FOREWORD

Despite its proven negative consequences, substance abuse is a pervasive phenomenon that has slowly encroached on the Maldivian society over the past few decades. Consequently, the drug endemic has exacted a toll on our public health systems, our economy and wrested the social and moral fabric of this small republic into pieces. Unfortunately, substance abuse has reached the younger generations all over the world, and Maldives is no exception.

Despite plenty of evidence linking regular use of narcotic substances to health problems, there is often a considerable disconnect between the proven tangible risks and public perception of the habit. Peer-reviewed studies published both globally and locally note that peer pressure, curiosity or urge to experiment, and availability of substances are the most common denominators leading youth to substance use. Over time, access to drugs has also become easier and there is a wider pool of sources - major drug markets on the dark web, contactless drug transactions, drug cartels, etc., influencing the number of people engaging in substance abuse. The phenomenon of online drug sales was quite possibly accelerated due to the COVID-19 pandemic.

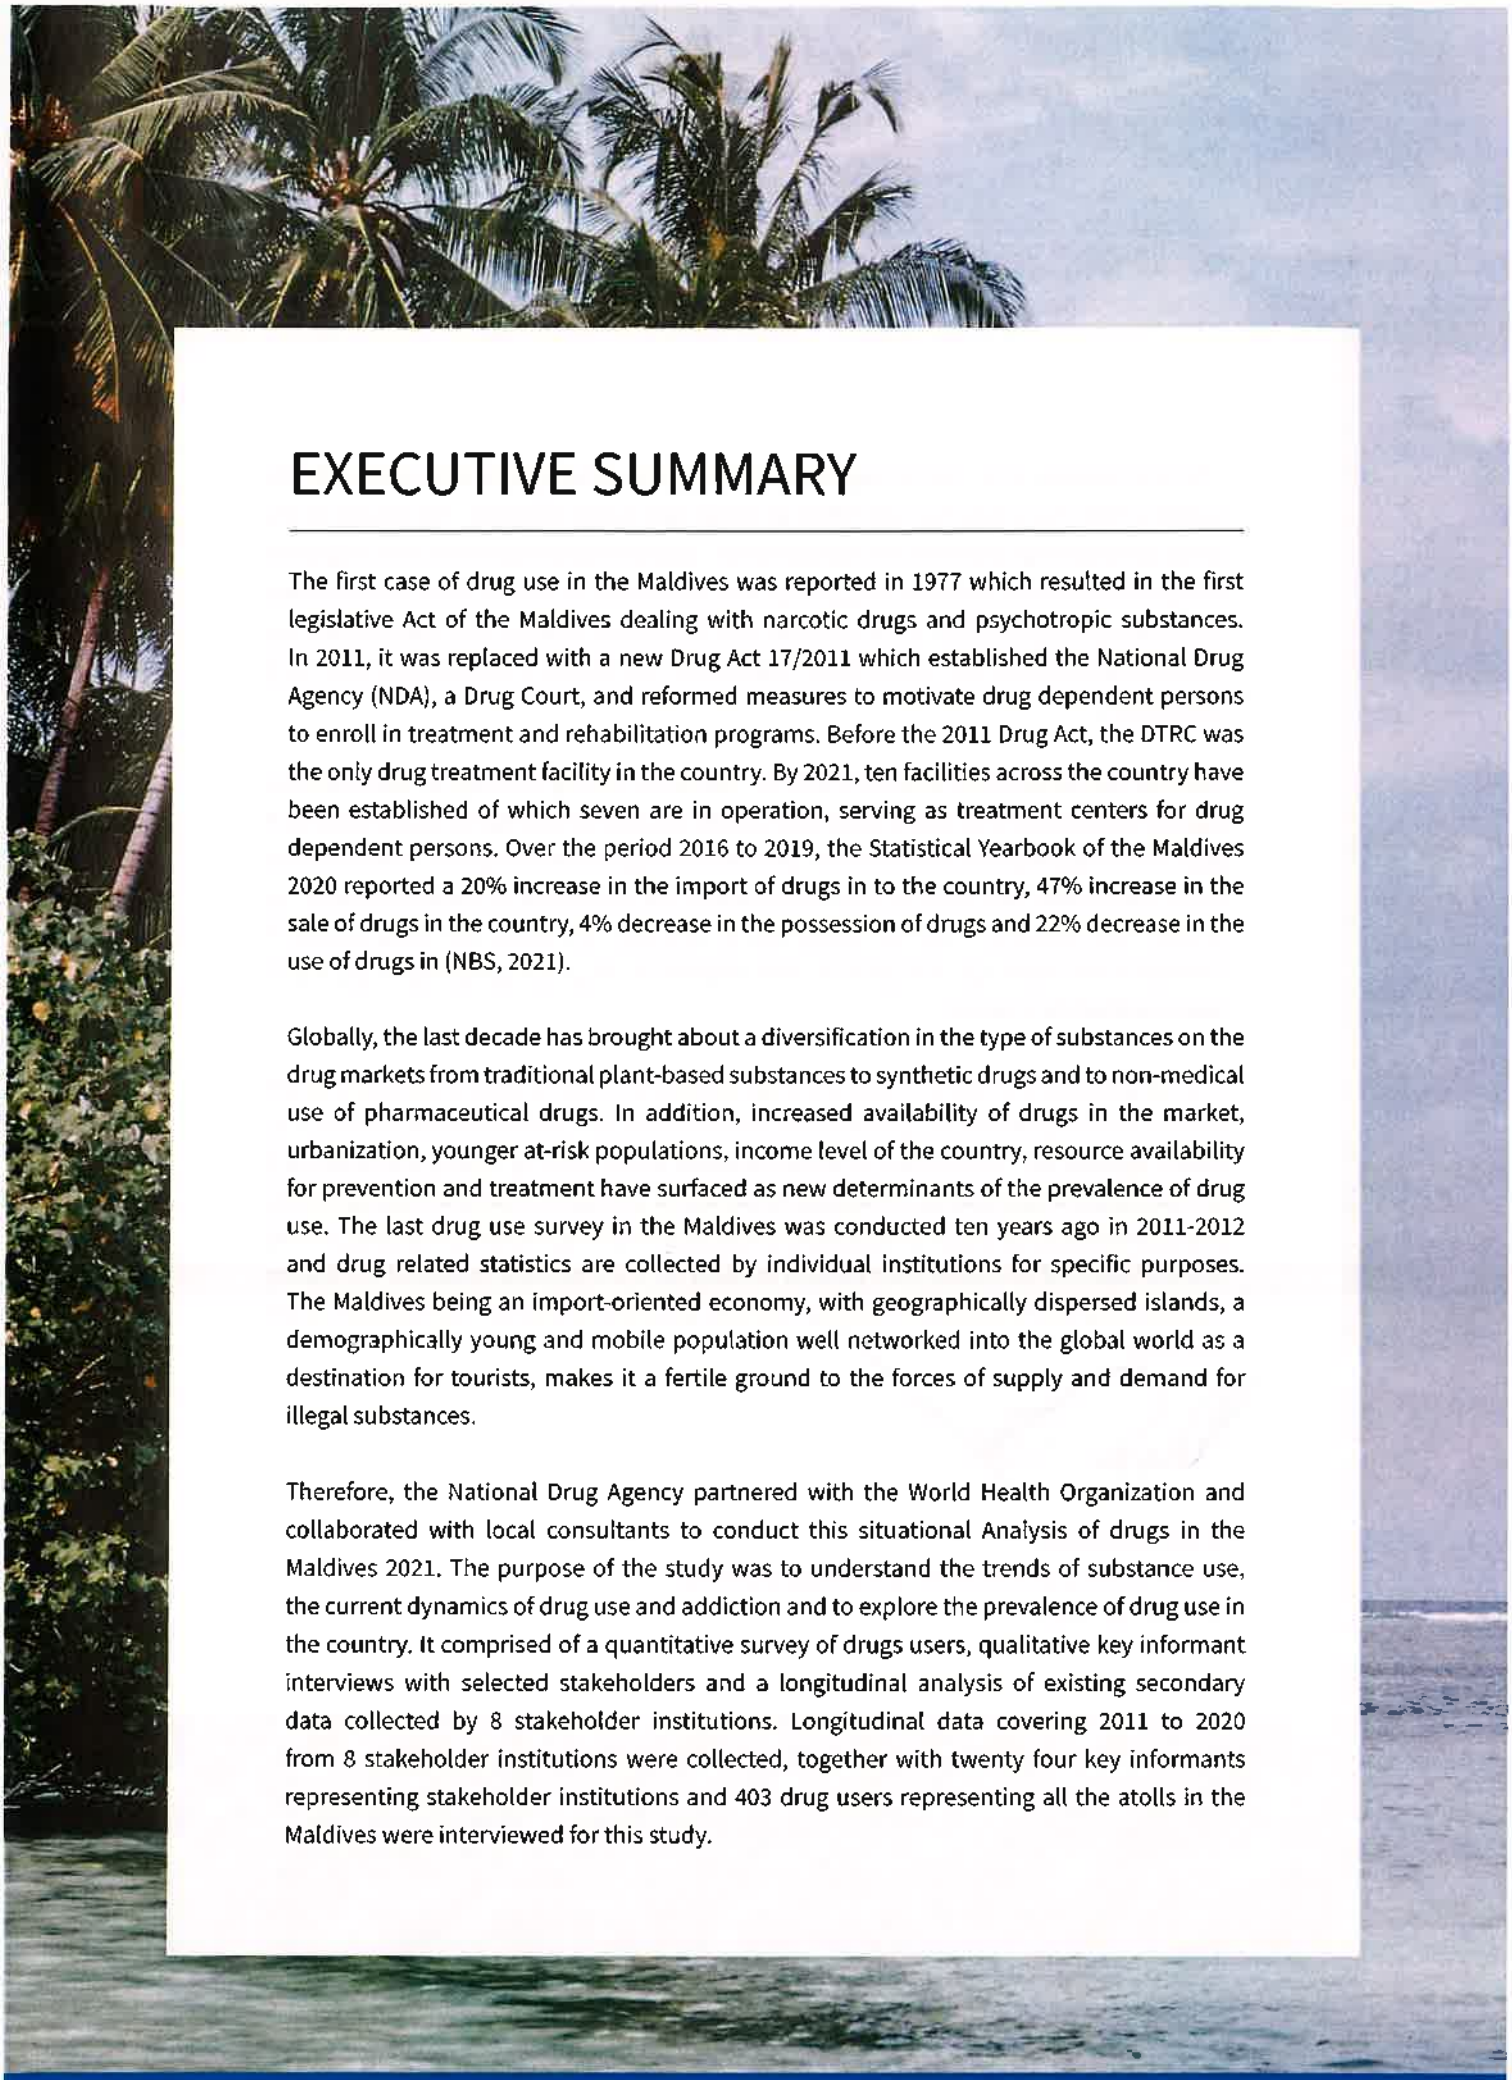
As a result, the number of people seeking treatment has increased. However, low accessibility to services due to a severe lack of qualified human resources remains the biggest challenge and is the key area of concern at present. Additionally, communicating facts about drugs and promoting evidence-based interventions is an absolute necessity to reduce demand and supply of drugs, whilst also facilitating access to controlled medicines for those in need. It is also the surest path to eliminating stigmatization and discrimination and providing adequate treatment. Furthermore, overcoming misunderstandings and barriers that prevent wider adoption of drug treatments at health facilities is crucial for tackling the problem of substance abuse in the Maldives.

The first National Drug Use Survey in the Maldives was conducted in 2011-2012 with the support from the United Nations Office on Drugs and Crime (UNODC). The results of the study showed a high prevalence of substance use – accounting for more than 7000 drug users in the Maldives. After a decade long period with no surveys or studies done to understand the evolving drug situation in the Maldives, this Situational Analysis was finally conducted in 2021 in partnership with World Health Organization (WHO) and in collaboration with local consultants.

The five year (2016-2020) secondary data on laboratory testing for drugs at National Drug Agency shows more than 50,000 tests were carried out with an average of 10,000 tests each year. The results indicate the number of patients testing positive for opiates have increased more than 2 fold from 2016 to 2020. Additionally, the preference of substance users has shifted from naturally occurring substances to synthetic. Moreover, the study shows an increase in the mean age of substance users arrested by the police compared to 2015 (27.7 years) to 2020 (31.3 years).

It is my pleasure to present to you the Drug Situational Analysis Report that explores the current trends, dynamics and prevalence of substance use and addiction in the country. This report signifies our commitment to evidence-based policy-making, raising awareness and combating the drug situation in Maldives. As the aim of this report is to inform policymakers, practitioners, and the public of facts about the substance abuse problem in Maldives, it is my sincere hope that this publication paves a pathway for multi-sectoral collaboration, sharing evidence and information, and making informed decisions to improve the situation in the Maldives.

Ahmed Naseem
Order of the Dignified Rule of Muleege Dynasty
Minister of Health



EXECUTIVE SUMMARY

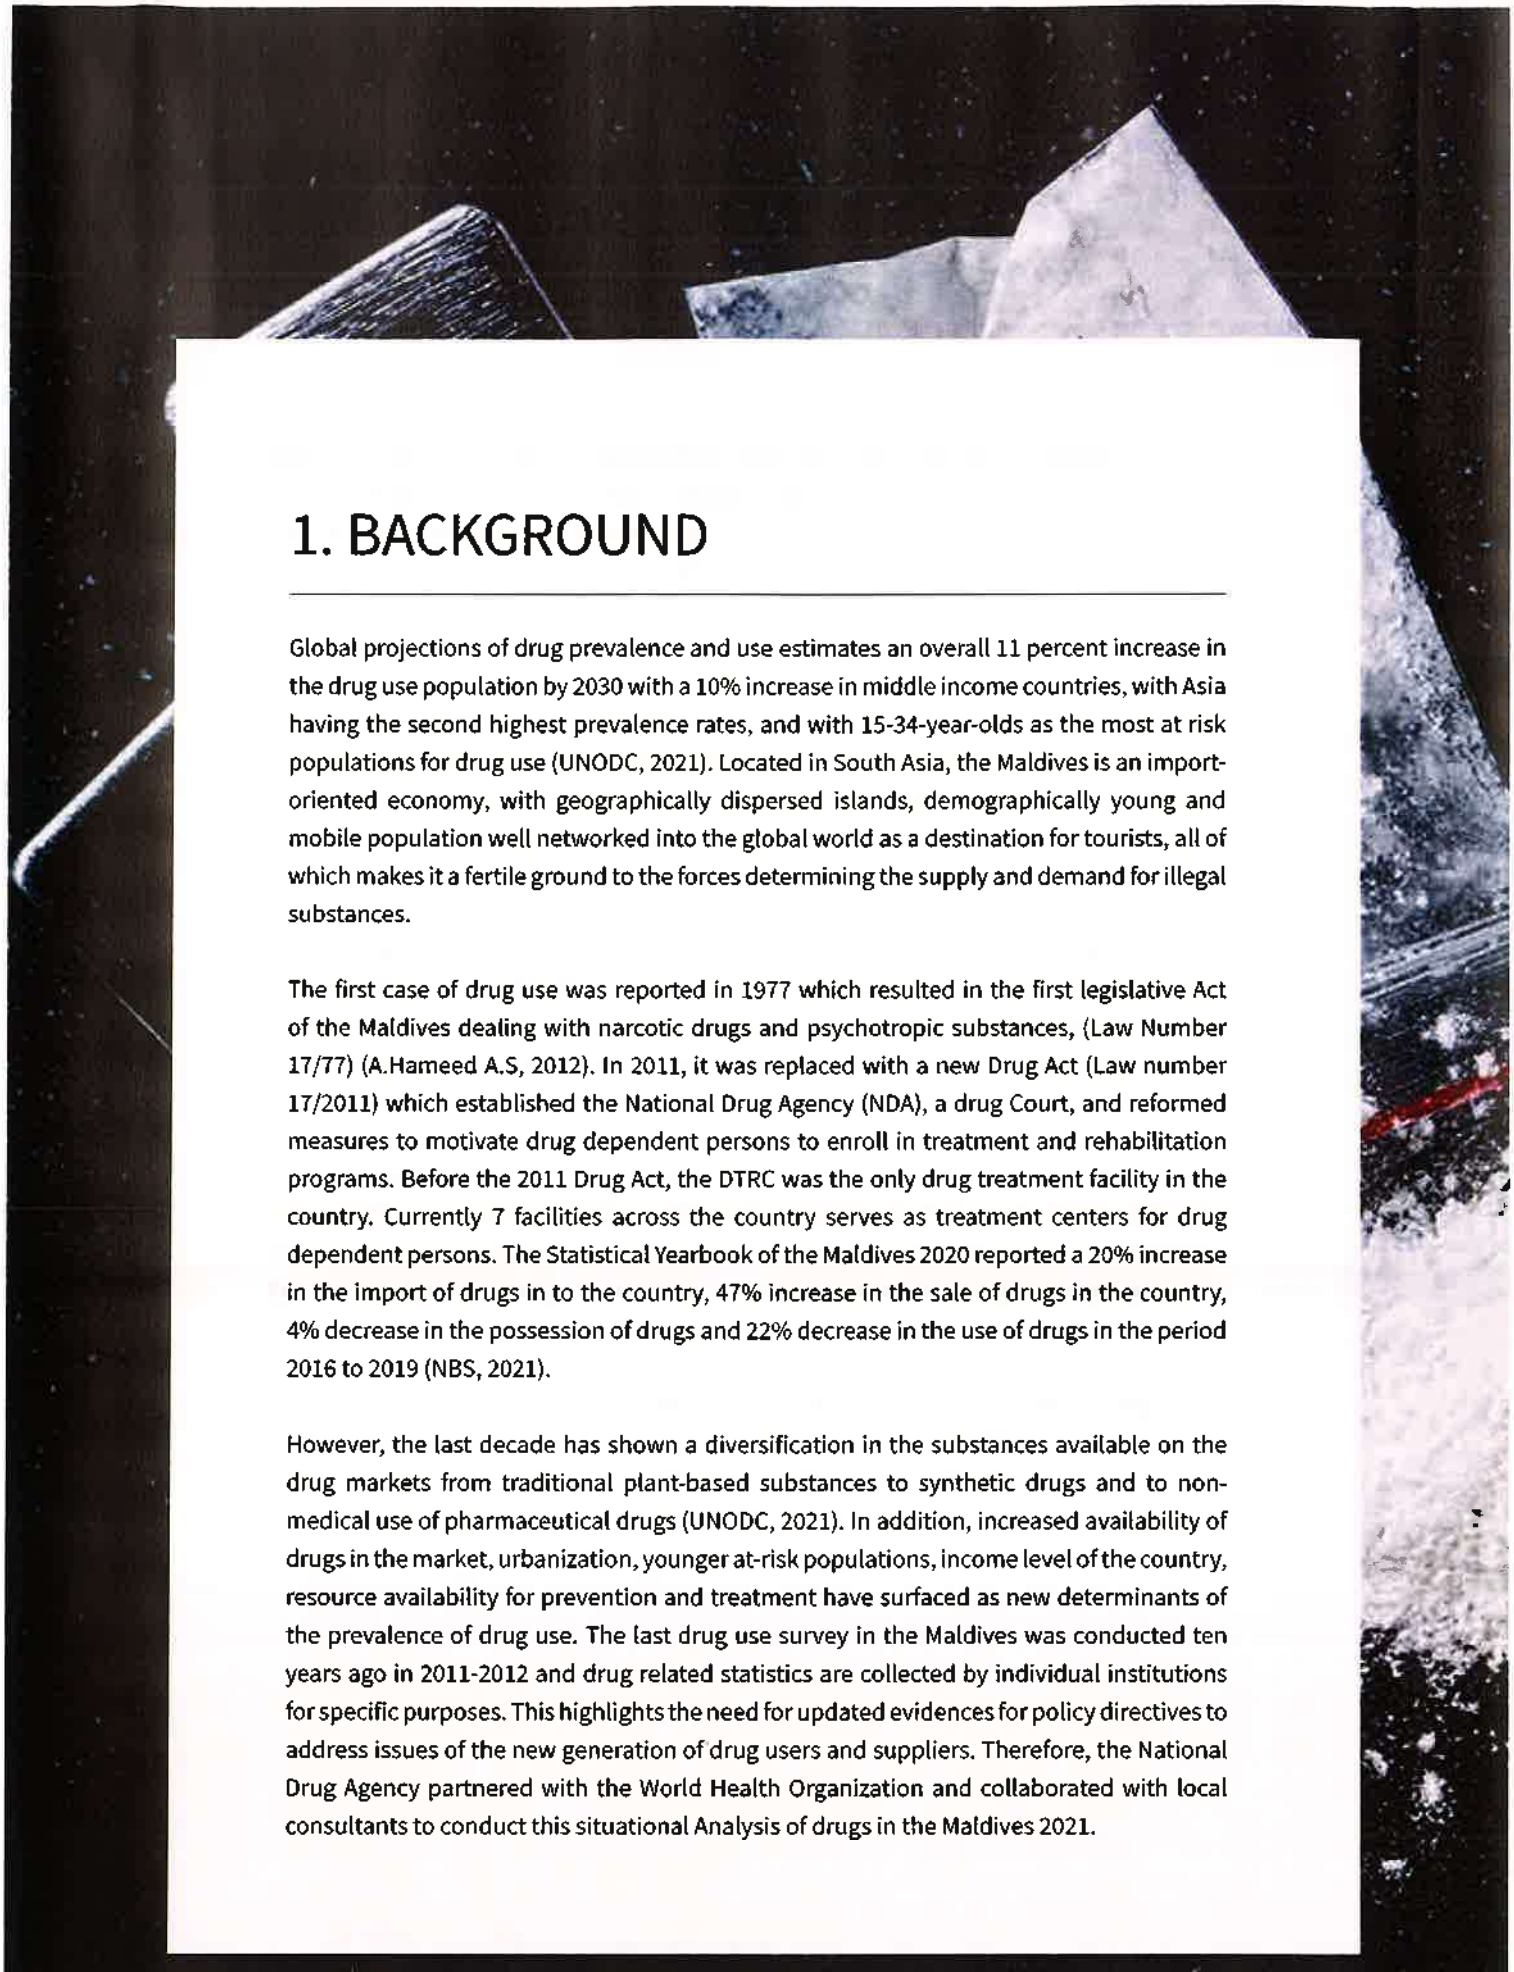
The first case of drug use in the Maldives was reported in 1977 which resulted in the first legislative Act of the Maldives dealing with narcotic drugs and psychotropic substances. In 2011, it was replaced with a new Drug Act 17/2011 which established the National Drug Agency (NDA), a Drug Court, and reformed measures to motivate drug dependent persons to enroll in treatment and rehabilitation programs. Before the 2011 Drug Act, the DTRC was the only drug treatment facility in the country. By 2021, ten facilities across the country have been established of which seven are in operation, serving as treatment centers for drug dependent persons. Over the period 2016 to 2019, the Statistical Yearbook of the Maldives 2020 reported a 20% increase in the import of drugs in to the country, 47% increase in the sale of drugs in the country, 4% decrease in the possession of drugs and 22% decrease in the use of drugs in (NBS, 2021).

Globally, the last decade has brought about a diversification in the type of substances on the drug markets from traditional plant-based substances to synthetic drugs and to non-medical use of pharmaceutical drugs. In addition, increased availability of drugs in the market, urbanization, younger at-risk populations, income level of the country, resource availability for prevention and treatment have surfaced as new determinants of the prevalence of drug use. The last drug use survey in the Maldives was conducted ten years ago in 2011-2012 and drug related statistics are collected by individual institutions for specific purposes. The Maldives being an import-oriented economy, with geographically dispersed islands, a demographically young and mobile population well networked into the global world as a destination for tourists, makes it a fertile ground to the forces of supply and demand for illegal substances.

Therefore, the National Drug Agency partnered with the World Health Organization and collaborated with local consultants to conduct this situational Analysis of drugs in the Maldives 2021. The purpose of the study was to understand the trends of substance use, the current dynamics of drug use and addiction and to explore the prevalence of drug use in the country. It comprised of a quantitative survey of drugs users, qualitative key informant interviews with selected stakeholders and a longitudinal analysis of existing secondary data collected by 8 stakeholder institutions. Longitudinal data covering 2011 to 2020 from 8 stakeholder institutions were collected, together with twenty four key informants representing stakeholder institutions and 403 drug users representing all the atolls in the Maldives were interviewed for this study.

The main findings from the study demonstrates that the industry is still a very male dominated one. Demographically, it is the working age population that is benefiting and suffering from this trade. Over the past ten years, younger users and suppliers were observed and the share of the elderly is growing. New trends in the substance industry of the Maldives includes the introduction of new psychotropic drugs usage, the move from South Asian source countries to European countries as sources of drugs, a change from air and sea to mail as the transport mechanism , an increase in the accessibility of substance users to the medical care system, long waiting time to access treatment programs at NDA, the expansion of local production of substances, human trafficking among drug users and forcing them to commit other illegal activities, involvement of migrants in the drug trade, lack of community support, use of multiple sex partners, needle sharing and multiple use of one syringe where unavailability to new syringes were highlighted.

Systemic reforms are required to address the issue of substance use and minimize its impact on future generations. Although drug use has a long history in the Maldives, stakeholders in the industry are still working solo. A comprehensive integrated data management system with real time data from all the relevant institutions is needed to view the big picture of drugs in the country. New technological advancements are needed at NDA to test for new substances entering the market. Special attention needs to be given for students in middle school (grades 6 – 9) and the period of transition from O Level completion and beyond, with close monitoring of school dropouts and students not attending school. Stakeholder collaborations between government and non-governmental organizations can assist minimize the waiting time between drug court orders and assessment completions, OR assessment completion to treatment or to the implementation of the sentence. Families and the communities are still in need for attitudinal transformation towards substance use and targeted interventions are needed for the vulnerable populations (juveniles, elderly, migrants) at risk of falling into the hands of the drug industry.



1. BACKGROUND

Global projections of drug prevalence and use estimates an overall 11 percent increase in the drug use population by 2030 with a 10% increase in middle income countries, with Asia having the second highest prevalence rates, and with 15-34-year-olds as the most at risk populations for drug use (UNODC, 2021). Located in South Asia, the Maldives is an import-oriented economy, with geographically dispersed islands, demographically young and mobile population well networked into the global world as a destination for tourists, all of which makes it a fertile ground to the forces determining the supply and demand for illegal substances.

The first case of drug use was reported in 1977 which resulted in the first legislative Act of the Maldives dealing with narcotic drugs and psychotropic substances, (Law Number 17/77) (A.Hameed A.S, 2012). In 2011, it was replaced with a new Drug Act (Law number 17/2011) which established the National Drug Agency (NDA), a drug Court, and reformed measures to motivate drug dependent persons to enroll in treatment and rehabilitation programs. Before the 2011 Drug Act, the DTRC was the only drug treatment facility in the country. Currently 7 facilities across the country serves as treatment centers for drug dependent persons. The Statistical Yearbook of the Maldives 2020 reported a 20% increase in the import of drugs in to the country, 47% increase in the sale of drugs in the country, 4% decrease in the possession of drugs and 22% decrease in the use of drugs in the period 2016 to 2019 (NBS, 2021).

However, the last decade has shown a diversification in the substances available on the drug markets from traditional plant-based substances to synthetic drugs and to non-medical use of pharmaceutical drugs (UNODC, 2021). In addition, increased availability of drugs in the market, urbanization, younger at-risk populations, income level of the country, resource availability for prevention and treatment have surfaced as new determinants of the prevalence of drug use. The last drug use survey in the Maldives was conducted ten years ago in 2011-2012 and drug related statistics are collected by individual institutions for specific purposes. This highlights the need for updated evidences for policy directives to address issues of the new generation of drug users and suppliers. Therefore, the National Drug Agency partnered with the World Health Organization and collaborated with local consultants to conduct this situational Analysis of drugs in the Maldives 2021.

a. Objectives

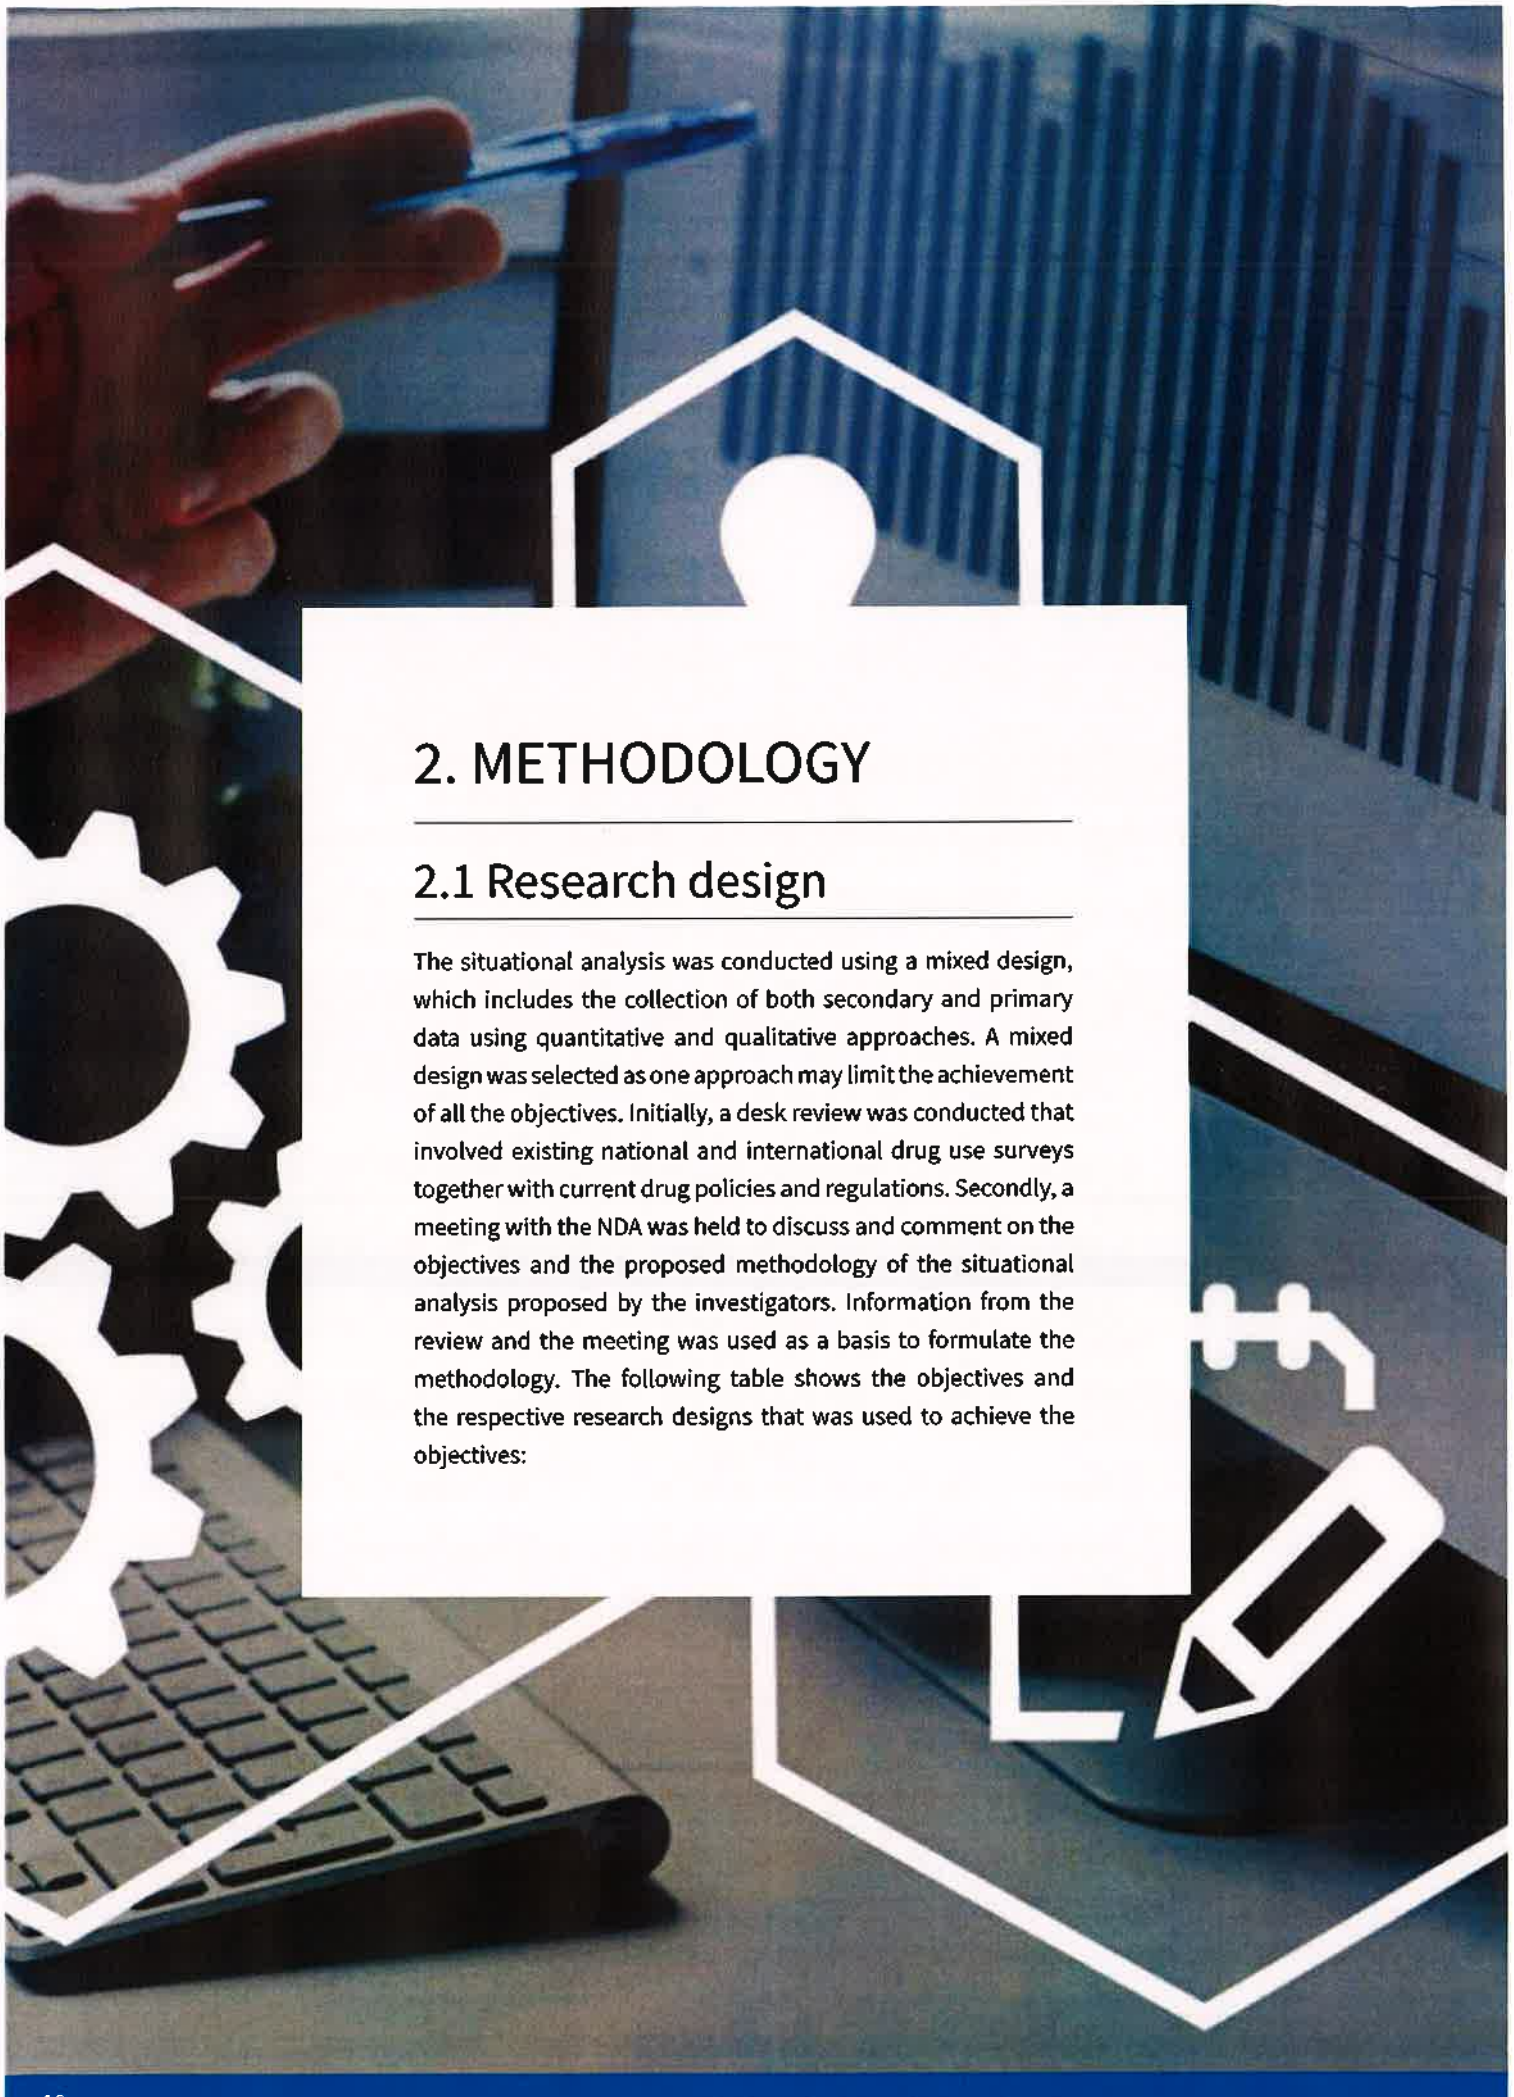
The purpose of the situational analysis is to take a snapshot picture of the drug use and addiction in the Maldives ten years after the last Drug use survey was conducted in 2011-2012 and the first Rapid Assessment of drug abuse in the Maldives in 2003. Hence, the Specific objectives of this study were:

To identify the current dynamics of drug use and addiction in the country

To identify the major changes in the trends and onset of substance use.

To estimate the prevalence and Incidence of substance use and changes to the prevalence rate

To map the gaps in drug use data in the country



2. METHODOLOGY

2.1 Research design

The situational analysis was conducted using a mixed design, which includes the collection of both secondary and primary data using quantitative and qualitative approaches. A mixed design was selected as one approach may limit the achievement of all the objectives. Initially, a desk review was conducted that involved existing national and international drug use surveys together with current drug policies and regulations. Secondly, a meeting with the NDA was held to discuss and comment on the objectives and the proposed methodology of the situational analysis proposed by the investigators. Information from the review and the meeting was used as a basis to formulate the methodology. The following table shows the objectives and the respective research designs that was used to achieve the objectives:

TABLE 1: LIST OF OBJECTIVES AND RESPECTIVE RESEARCH DESIGNS

Objectives	Proposed Research Design
1. Identify the current dynamics of drug use and drug addiction	Primary data – Quantitative survey of users
2. Identify the major changes in the trends and onset of substance use.	Secondary Data Analysis
3. Estimate the prevalence / incidence of substance use and changes to the prevalence rate	Secondary Data Analysis
4. Explore the gaps in drug use data in the country	Secondary Data Analysis

2.1.1 Secondary Data Analysis - Trends

A list of current stakeholders was made. An official letter was sent to each institution to acquire the data they collect on drug use, addiction, awareness, treatment, rehabilitation, prevention and behaviors covering the period 2010 to 2020. The list of stakeholders identified and discussed at the meeting with NDA are in table 2. Data was collected on the formats and templates used by the institution instead of sharing a common template for all. This will help understand the characteristics of the variables, acquire data in their raw form and map the existing data generated in the country on drug use. Eleven datasets from ten institutions were analyzed for this report.

TABLE 2: LIST OF STAKEHOLDERS FROM WHOM SECONDARY DATA WILL BE COLLECTED.

Health Protection Agency	×	Health Centers / MOH	

2.1.2 Primary Data Analysis

In order to understand the situation of substance use and addiction the perspective of both the user and the service providers is important. Perspective of the user was obtained through a quantitative survey of drug users across the country, while the perspective of the providers was sought through a number of qualitative methods

2.1.2.1 Quantitative Survey of Drug Users

A cross section of drug users across the country was surveyed. In order to make the survey representative of all drug users in the country, a sample from each atoll and Male' area was taken. Secondly, Snow balling technique was used to reach out to the drug users who are not in the system. This was expected to be 15-20% of the incident cases (MPS, 2020). Any duplication of users was minimized by asking if they have filled the questionnaire before.

2.1.2.2 Qualitative survey of service providers/educators/stakeholders

Indepth interviews were held with key informants from selected 5 atolls. The representative and their roles are identified in Appendix A. In addition, a Focus Group Discussion was held with selected service providers who are representative of Atolls and Male' region, private and public sectors and NGOs. The list and selection of providers and educators was made by the National Drug Agency. The interview guide in Appendix B was used. The Potential Outputs from this component of the study are the provider view of the drug situation, existing Treatments/services and quality of services, a sense of the demand for services/ care, alternative models of interventions/testing applicable to specific locations or sub populations, gaps in supply and the effect of policies and regulations on the industry.

2.2 Sample, population or subjects

2.2.1 Quantitative survey of drug users

According to statistics from the National Bureau of Statistics (2019), there were on average 1271 reported cases of drug abuse per year in the country over the last ten years. Statistics from the Maldives Police Service (2020) showed that 2894 drug related incidents were reported in 2020. NDA data contains only the cases that seek treatment while data from MPS represents cases sought proactively from the community and is representative of all the atolls of the country. Hence, MPS data was used in the calculation of the sample size of this study. The drug user registry at NDA and its treatment centers was used as the sampling frame for the study. From the frame, a random sample of drug users was selected from each atoll. In order to stratify the sample by atolls, the following stratified sampling formulae was used.

$$n = \frac{n_0}{1 + \frac{n_0}{N}}$$

where,

$$n_0 = \frac{(Z^2)p(1-p)}{e^2}$$

and

$$n_h = n\,\frac{N_h}{N}$$

where N_h *is the size of the stratum*, h = 1,2,3,4,.....n

The estimations are as follows:

$$n_0 = \left(\frac{(1.96^2 x\ 0.62\ x\ 0.38)}{0.05^2}\right) = 362.0323$$

$$n = \frac{362.03}{1 + \frac{362.03}{557{,}426}} = 362.0006$$

Using 95% confidence level and a margin error of 5%, a sample size of 362 drug users are required. $n_h = n\,\frac{N_h}{N}$, was used to estimate the minimum sample size required from each atoll, and table 3 lists the strata wise sample size requirements for this survey. The prevalence level of 0.62% used in the formulae was an estimation done using the 2020 data of MPS with an addition of 20% to represent those who are out and beyond the system. Hence Prevalence = ((2894)+(0.2*2894)/557,426) = 0.00623 (0.62%). Estimates for the total population was derived from projected Population table 3.13 of the Statistical Yearbook 2020. The island from each atoll from where data will be collected will be identified using MPS data of highest incident cases. Table 3 demonstrates sample sizes by sub populations.

TABLE 3: SAMPLE SIZE BY ATOLL

Gn	184	23	18	5
S	232	29	23	6
	2894	362	290	72

For the purpose of this study drug users are defined as anyone living in Maldives either Maldivian or foreigner who has been abusing or using any psychotropic substance without a proper prescription for the intentions of getting intoxicated or support an addiction.

INCLUSION CRITERIA OF USERS

1. Participants have to be residing in Maldives
2. Participants should have abused/used any form of psychotropic substance without a prescription including the use of prohibited narcotics drug by Maldivian law

EXCLUSION CRITERIA OF USERS

1. Those who are currently out from Maldives during the time of data collection of the study, including temporary travelling
2. Those who are using psychotropic substance with a proper medical prescription

2.2.2 Qualitative Survey of Providers

24 key informants from 3 Atolls were interviewed and one focus group discussion representing service providers was held with relevant stakholders from Male' and the central region including community members.

2.3 Instruments and materials

The Drug Survey of (UNODC, 2013) and the Rapid Assessment of the drug situation in the Maldives (NCB, 2003) was used as a basis to formulate a structured questionnaire (Appendix C) to be administered on drug users. Questions are presented in both English and Dhivehi. The 63 item questionnaire is divided into 7 blocks consisting of demographics of users, Patterns of use/addiction, High risk behaviors, Onset/Initiation, Source & type of onset, Use & Demand for services, Quality of services, determinants, Coping mechanism, Harm reduction, Family impact, community integration. The question guide that was used in the FGD is available in Appendix D.

2.4 Validity/Reliability

The questionnaire of the Drug user survey and question guide of the indepth interviews were checked for face validity through expert opinion and pilot testing. Expert review was sought through a stakeholder meeting held to discuss the methodology of the study, questionnaire, sampling technique, sample size, etc. The questionnaire was also peer reviewed by seven public health professionals and their feedback was incorporated. Questionnaire was designed based on the previous drug use surveys in the country and customized to the current context of drug use in the country. Indicative Assessment currently used by NDA was used to formulate questions. Standardized instruments such as DAST-20 and SAMHSHA was used as references in the design of the instrument. The instrument was pre-tested on 4-5 users to assess the practicality of usage. Trained enumerators were used to administer the questionnaire while the FGDs were moderated by the principal and co investigators who are trained in the technique. Normality tests were conducted to understand the skewness of the distributions. Figure 1 shows the histogram and qqplot of the Age variable which looks very normal. However, Shapiro wilk test for normality produced a p value = 0.00035 indicating non-normality of the variable. Hence the variable was analyzed after grouping the variable into five-year age groups. Any disaggregation of the variable or any inferential statistics using non-normal variables was done using non-parametric analysis. The drug user survey was found to be a very representative sample with people from all the atolls of the country (Table 4). Resident atoll was the place where the client or the user normally resides. The required number of the sample size for each strata or more was acquired. 69.5% were drawn from the NDA client registry and 30.5% were drawn using snowballing technique. While collecting secondary data, each institution was requested to send the data in the existing formats or templates used by the organization. This was to minimize errors in data sharing and data transfer.

2.5 Data Management and Data Analysis

Secondary Data: Except for NDA, other institutions-maintained data electronically and shared the data in the same way. At NDA, a client register and laboratory data were maintained electronically. However, data on the assessments, and screening were manually kept in files. A random sample of 1% of these files from each year was collected. Table 5 shows the number of files entered electronically for each year. A total of 38 files were entered and analysed. To estimate the prevalence, Mid year projected population was obtained from NBS 2021 for each age group. For instance, for calculating the prevalence of juvenile substance use/trafficking, the population 0-19 years was used as the denominator. To assess the changes in prevalence, 2015 and 2019 was selected as 2020 showed that data was affected by the patterns and lifestyle changes due to the pandemic. Also 2011 population was not available to make a 10 year prevalence estimate.

TABLE 5: RANDOM SAMPLE OF 1% OF CLIENT FILES AT NDA

YEAR	TYPE	TOTAL CLIENTS	1%	CLIENT NUMBERS			
2015	RELEASED	197	2	4485	4513

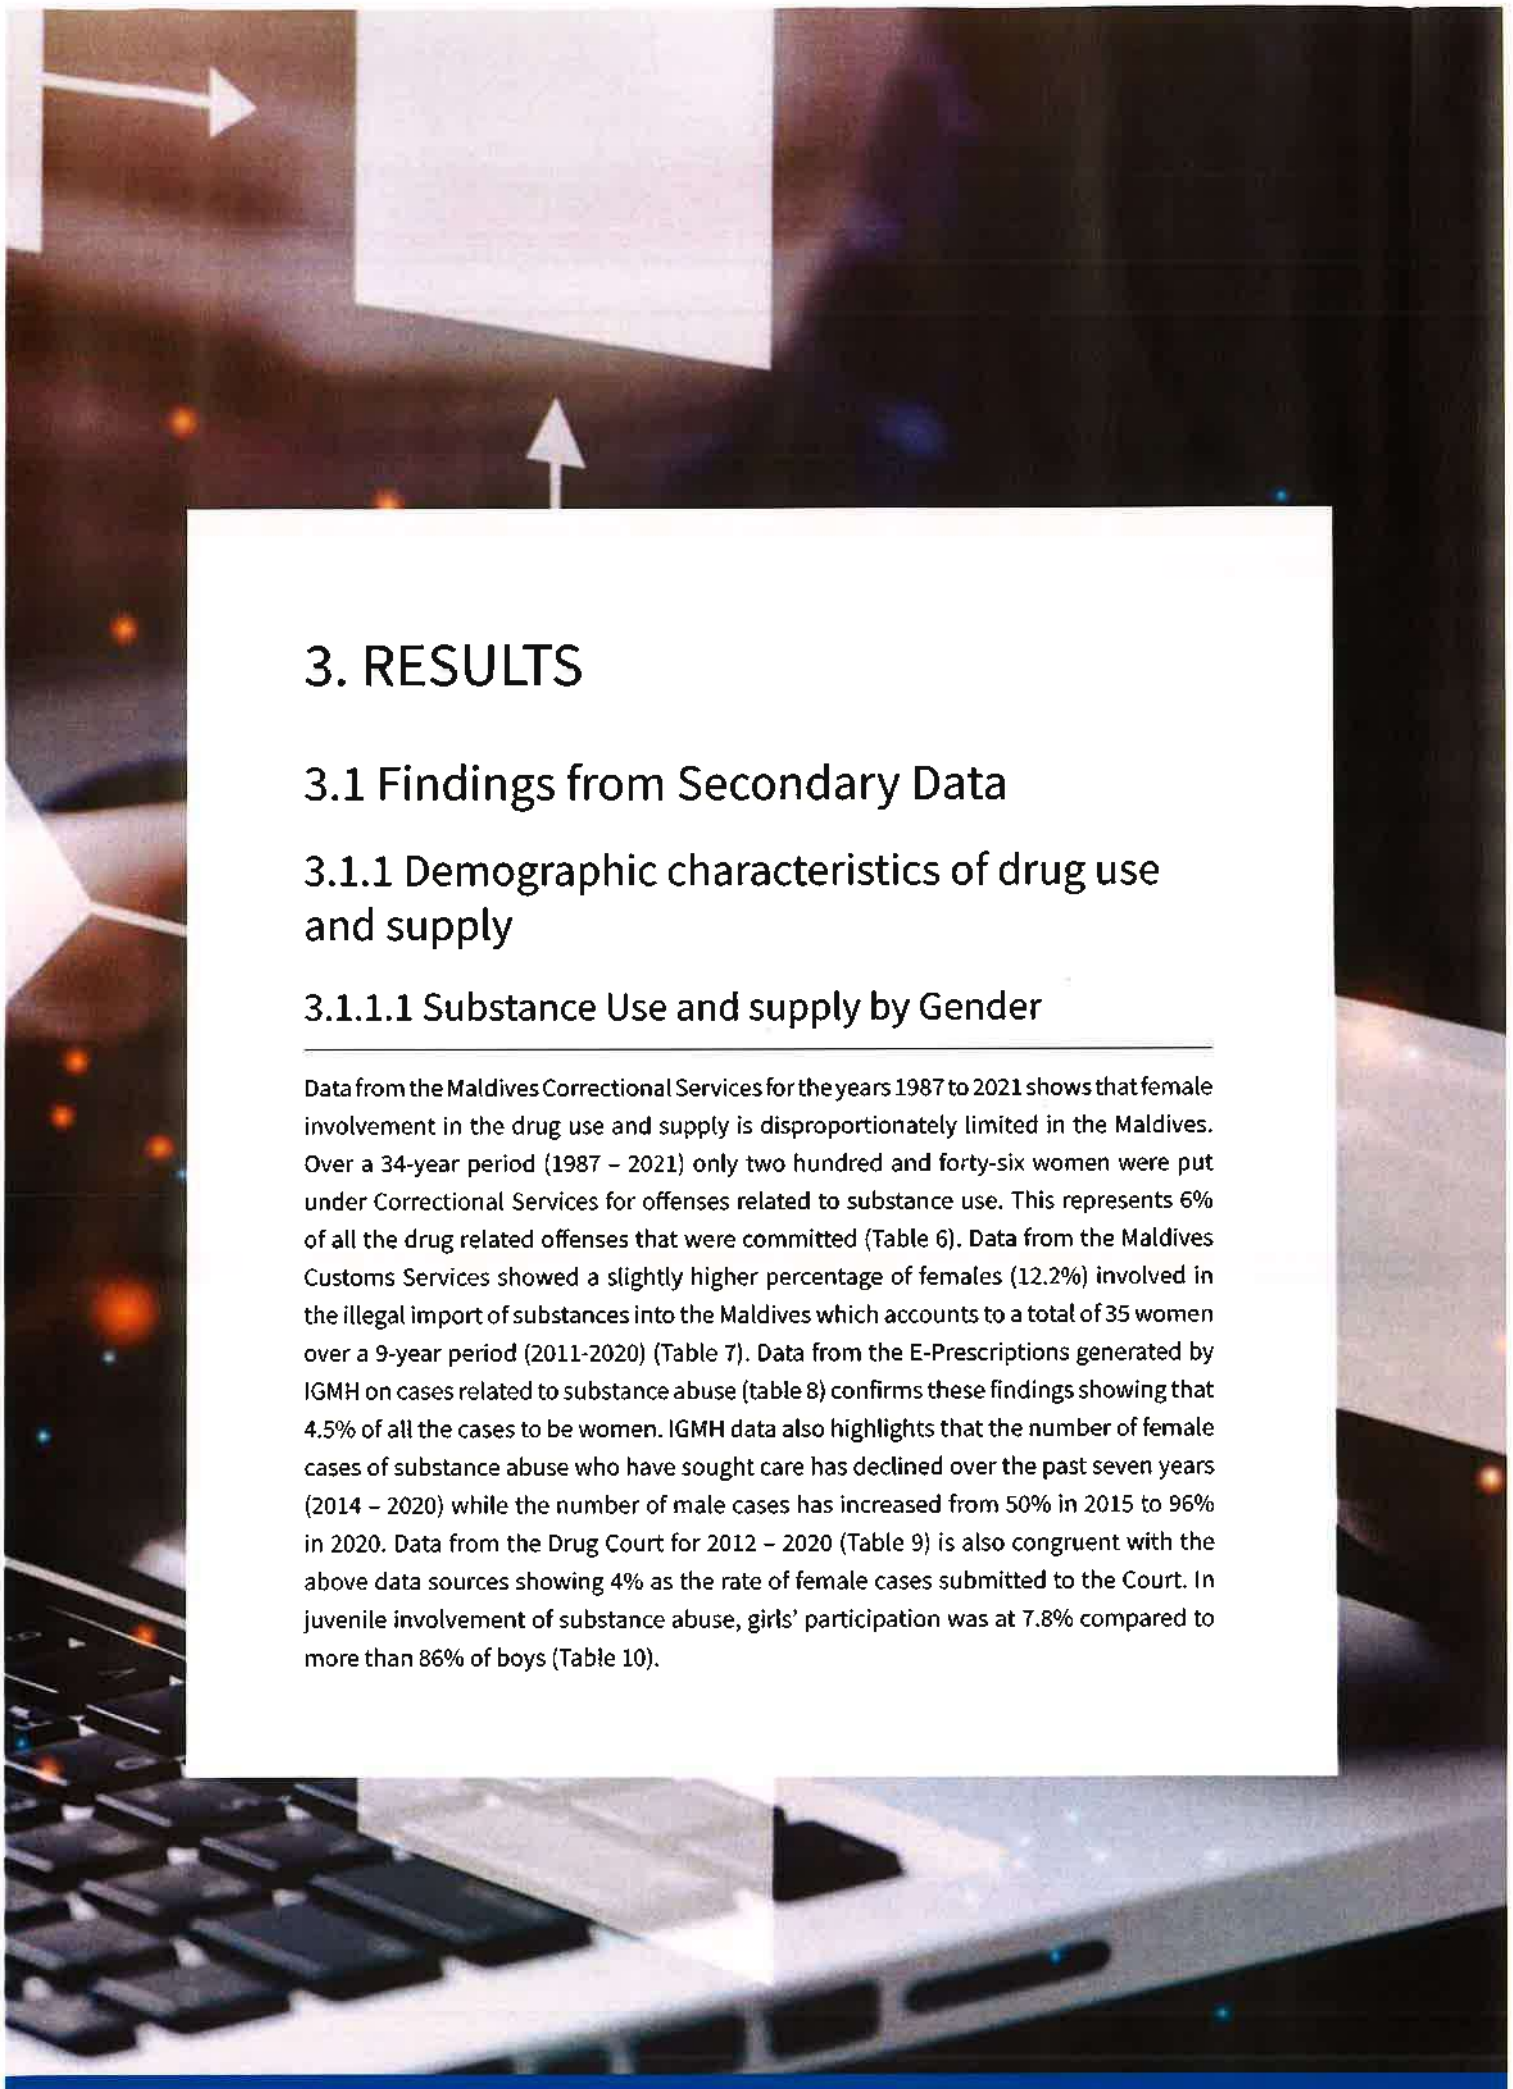
2020	RELEASED	202	2	8366	8299		
2020	TERMINATED	96	1	8595			
			29				

Quantitative survey of users: Data was collected on google forms by the researcher. The automatically entered dataset was cleaned and analyzed in SPSS. Descriptive and inferential statistics were generated to achieve the objectives where graphs and tables were formulated using Excel spreadsheets. Qualitative interviews with service providers/educators/stakeholders: Each KII lasted one hour and the FGD lasted 2.5 hours. Estimated 4-5 hours of transcribing were needed for each interview. Thematic analysis was done to draw the major themes from the data.

2.6 Ethical considerations

Though drug use/abuse or possession of drugs or trafficking of drugs is a crime in the Maldives and withholding information of a person who has used drugs is also a crime in Maldives, any issues that may raise was addressed with the assistances of a collaborative between National Drug Agency and Maldives Police Services. Measures needed to assure anonymity for the users of the survey include, telephone surveys instead of face to face surveys where requested, use of drop in centers or care facilities to administer the interviews. The methodology of this study was submitted and approved by the National Drug Agency and the World Health Organization.



3. RESULTS

3.1 Findings from Secondary Data

3.1.1 Demographic characteristics of drug use and supply

3.1.1.1 Substance Use and supply by Gender

Data from the Maldives Correctional Services for the years 1987 to 2021 shows that female involvement in the drug use and supply is disproportionately limited in the Maldives. Over a 34-year period (1987 – 2021) only two hundred and forty-six women were put under Correctional Services for offenses related to substance use. This represents 6% of all the drug related offenses that were committed (Table 6). Data from the Maldives Customs Services showed a slightly higher percentage of females (12.2%) involved in the illegal import of substances into the Maldives which accounts to a total of 35 women over a 9-year period (2011-2020) (Table 7). Data from the E-Prescriptions generated by IGMH on cases related to substance abuse (table 8) confirms these findings showing that 4.5% of all the cases to be women. IGMH data also highlights that the number of female cases of substance abuse who have sought care has declined over the past seven years (2014 – 2020) while the number of male cases has increased from 50% in 2015 to 96% in 2020. Data from the Drug Court for 2012 – 2020 (Table 9) is also congruent with the above data sources showing 4% as the rate of female cases submitted to the Court. In juvenile involvement of substance abuse, girls' participation was at 7.8% compared to more than 86% of boys (Table 10).

3.1.1.2 Substance Use and supply by Age

According to data from the Maldives Customs services (Table 11), 56.9% of the drug importers were in the age group 19 – 64 years. 3.5% were under age and only 0.7% were in the elderly age group (>65years). The median age of substances users who seek health care has increased from 24 years in 2014 to 34 years in 2020 (Table 12). The youngest age seeking care for substance use has fallen from 22years to 17 years in 2020. The maximum age has risen from 37 years to 68 years in 2020 showing a trend of the adults and the elderly falling into the hands of the industry. Data from Police Services (Table 13) show that more than 95% of the offenders of substance use fall in the age group 19 – 64years. This percentage has risen from 86% in 2015. The percentage of underage offenders have decreased by half from 10% in 2015 to 4.5% in 2020 indicating it as a protective factor. However, involvement in the drug offense by the elderly has risen from 0% in 2015 to 0.1% in 2020. Across the Atolls of Maldives, percentage of underage offenders (<18 years of age) ranged from 3% to 13% of the total number of cases. The highest number of underage cases (<18 years) of drug offenders were found in Gnaviyani Atoll and Shaviyani Atoll (13.1%), Dhaalu Atoll (12.4%), Raa Atoll and Meemu Atoll (12%) during the period 2015-2020 (Table 14). Over the past 10 years (2010 – 2020), the Juvenile Justice Unit has received a total of 814 cases related to substance use. From 2010 to 2020 there has been a steady increase in the number of cases. However, 2020 showed a sharp decline in the number of reported cases of juvenile substance use (69 cases in 2020 versus 119 in 2019). By age, it was noticeable that the greatest number of cases were in the ages 15, 16, and 17years (17%,25% and 43% respectively) (Table 15).

3.1.1.3 Substance Use and Supply by Residency/Location

Table 13 of MPS data, Table 16 of Drug Court data and Table 17 of JJU data all confirms that no atoll in the country is free of substance use and it is existent in all the atolls of the country. Offenders of substance was most common in the central Kaafu Atoll which includes the capital city Male'(27% of the total population). Second highest prevalence was seen in the Southern most three atolls GaafuDhaalu Atoll, Gnaviyani Atoll and Seenu Atoll (Table 16). A similar pattern is found in the underage category too, where most of the juvenile cases of substance use was reported from Kaafu Atoll, Male' city, Gaafu Dhaalu Atoll, Gnaviyani and Seenu Atoll (Table 17).

3.1.1.4 Substance Use and Supply by Education

Among the secondary datasets, only very few institutions collect data on educational level (JJU and NDA). Out of all the cases reported to the JJU during 2010 – 2020, it was found that more than half were out of school (51.6%). Drug usage while going to school stood at 17.7% and usage among children who have completed school was at 16.3% (Table 18).

3.1.2.1 Dynamics and trends in the Supply of Substances: Nationality of the person

Maldives Customs Service data confirms that the illegal trade of substances into the Maldives is mainly through Maldivian locals (59.8%). The remaining 40%, is distributed among nationals from across five continents. South Asian travelers were found to be the majority of traders who imported illegal substances into the Maldives; Bangaldeshis contributed 10.8% of the trade, Pakistanis (5.2%) and Indians (3.1%).

3.1.2.2 Dynamics and trends in the Supply of Substances: Type of Substances

In the past 10 years, the majority of drugs that were seized include psychotropic drugs – MDMA (27.6%), Heroine (21.7%) and Hashish Oil (10.8%) (Table 20). The type of drugs illegally being imported into the Maldives has seen drastic changes over the past ten years. In 2011, 61.5% of the seized drugs consisted of Cannabis in herbal form and 23% Heroine. By 2020, Cocaine contributed 24% of the seized drugs, 20% was heroine, 20% was cannabis-herbal and 20% psychotropic MDMA. New trends in the type of drugs that were observed are the import of cannabis seeds, Methcathinone, Ketamine and emphatamine (Table 21).

3.1.2.3 Dynamics and trends in the Supply of Substances: Weight of Drugs

Average weight of the drugs that were imported into the country ranged from 285g to 1831g over the period 2011 to 2020. Minimum weight ranged from 0.001g to 100g. Maximum weight carried ranged from 878g in 2012 to 10261g in 2016. Over the past 10 years, the maximum weight has increased from 1869g in 2011 to 4448g in 2020 (Table 22).

TABLE 22: WEIGHT OF DRUGS SMUGGLED INTO THE MALDIVES

3.1.2.7 Dynamics and trends in the Supply of Substances: Last port of departure of drugsof drugs

The last port of departure of the carrier of substances provides tactical information for surveillance (table 25). In 2011, the majority of the carriers departed from the South Asian countries; India (30.8%), Bangladesh (23.1%), and Sri Lanka (15.4%). By 2020, the trend has moved to European countries; UK (24%),Netherlands (20%). New countries include Brazil (4%), Czech Republic (4%), Ethiopia (4%). Carriers from Bangladesh has decreased from 23.1% in 2011 to 8% in 2020, from India it decreased from 30.8% in 2011 to 8% in 2020, from SriLanka it has decreased from 15.4% in 2011 to 0% in 2020. Carriers from Pakistan has increased from 7.7% in 2011 to 16% in 2020.

3.1.2.8 Dynamics and trends in the Supply of Substances: Illegal Carriers of drugs by ageof drugsof drugs

Table 27 shows data of carriers of substances illegally into the country by their age. Illegal import of substances has been committed by adolescents (14-19years); 12.5% of the illegal import in 2013, 15.4% in 2018 and 3.2% of 2019. In 2011, the carriers were in the age group 19 till 54years in comparison to 2020 where the carriers were slightly younger 19- 44years. 2020 data also highlights a protective factor where the vulnerable age groups (Children, adolescents and the elderly) have not been found to illegally carry substances into the country which may be due to the pandemic. In 2019, increased number of elderly have illegally carried substances into the country compared with 2011 (3.2% in 2019 versus 0% in 2011 among 64-69year olds and 54-59 year olds).

TABLE 27: ILLEGAL CARRIERS OF SUBSTANCES BY AGE

3.1.2.9 Dynamics and trends in the healthcare seeking behaviours of Substance users 2014 -2020 by age of drugsof drugs

E-Prescriptions data from IGMH over the period 2014 – 2020 shows that the majority of cases were diagnosed with 'F11-Opiod related Disorder' (69%) and 'F19-Other psychoactive substance related disorders' (17.8%) and 'F12-Cannabis related disorders' (5.8%). Outpatient and Inpatient data from IGMH showed that majority sought healthcare for F11-Opiod related disorders (26.7%), F19- disorders due to multiple drug use and use of other psychoactive substances (26%), X69- Intentional self-poisoning by and exposure to other and unspecified chemicals and noxious substances (9.2%) and X60- Intentional self-poisoning by and exposure to nonopioid analgesics, antipyretics and antirheumatics (8.9%).

Over a period of five years, 50,085 tests were conducted on substance related clients at the National Drug Agency. This is an average of ten thousand tests per year. During the period 2016- 2020, 7.6% tested positive for Opiates, 3.7% tested positive for THC, 1.4% for Benzodiazepines and 0.1% for cocaine, alcohol, amphetamines equally. Number of clients testing positive for opiates have increased from 5.9% in 2016 to 14.3% in 2020. Positivity rates for other substances remained stable over the years. Usage of mixed substances were observed from NDA Laboratory data 2016-2020. Among combinations of two substances, it was found that a majority of clients were positive for Opiate and Benzodiazepines (659/1410 clients OR 67%), 29% were positive for a combination of THC and Opiates and 8% for THC and Benzodiazepines. Positivity for a combination of three or more substances was not found.

Data of health care seeking behavior of substance users from IGMH data shows that the trend in the type of substances have changed over time. In 2011, it was alcohol (33%), unspecified drugs (33%) and history of other diseases (33%) which accounted for users. However, in 2020, opioid, cannabis, sedatives, and psychoactive substance related disorders were more common inthe e- prescriptions that were studied.

Healthcare seeking at Hospitals by substance users have changed during the past ten years. While 41.5% of the Opiod users sought care at IGMH in 2010, there were no cases in 2020. Similary there were no cases of cannabis users seeking care at the hospital in 2020. In 2020, users of sedatives, hallucinogens, tobacco, gases/vapours, exposure to other drugs acting on the autonomic nervous system have increased in comparison with 2011. This may have been due to the restrictions in supply in 2020 due to border closing. F18 has increased from 1.3 % in 2011 to 21.4% in 2020. X63 has also increased in 2020 which may reflect suicidal or mental issues.

3.1.2.10 Dynamics and trends in the sale of controlled drugs 2015 -2020 by ageof drugsof drugs

Data on the sale of controlled drugs at 3 pharmacies in the country shows that the most commonly sold controlled drugs are Alprazolam, Chlordiazepoxide, Clobazam, Clonazepam, Diazepam, Lorazepam, Midazolam, Pentazocine, Phenobarbitone, Olanzapine and Naltrexone. While the sale of Alprazolam, Chlordiazepoxide, Lorazepam, Midazolam, Phenobarbitone, Olanzapine has decreased at IGMH over the past five years, all the above have shown increased sales in Hulhumale pharmacy and Ungofaaru Pharmacy (Table 34).

TABLE 34: SALE OF CONTROLLED DRUGS AT 3 PHARMACIES IN THE COUNTRY

3.1.2.11 Dynamics and trends in Substance use in the Maldives 2011 -2020

Data from the Drug Court 2012 to 2020 indicates that the number of cases of substance abuse submitted to the Court has decreased by 33% during the period. The decreases were from Lhaviyani Atoll (-44%), Kaafu Atoll (-72%), Alif Alif Atoll (-83%), Alif Dhaalu Atoll (-85%), Meemu Atoll (-18%), Thaa Atoll (-11%), Gaafu Dhaalu Atoll (-11%) and Seenu Atoll (-45%). Number of Cases increased 300% in Faafu Atoll, 200% in Raa Atoll, 70% in Gaafu Alif Atoll, 70% in Gnaviyani Atoll, 67% in Shaviyani Atoll, 53% in Noonu Atoll and 27% in Laamu Atoll. The decreases may be due to factors such as increased police presence that reduce trafficking or due to internal migration to areas where access is easier.

Over the past ten years, the age group of majority offenders at the correctional services reflected the population demographics of the country; most being in the age groups 24 to 49 years. Compared to 2011 - 2017, recent years have seen adolescents (15-19years) being admitted to Correctional services. 95% of the offenders were in the age group 20 to 55 years of age (Table 36).

Cases of younger age groups (0-14years and 15-19years) have decreased over the past 5 years, according to the Maldives Police service data. By 2020, age groups 20 – 24years, 25-29years, have seen reductions or stability in the number of cases reported compared to 2011. Cases in the age groups 30 and above have increased in 2020.

The mean age of the substance users caught by the Police have increased from 27.7 years in 2015 to 31.3 years in 2020. The minimum age of offenders has risen from 12.7 years in 2011 to 14.6 years in 2020 which is a good sign.

Number of reported cases by Atoll show that in 2015, 65% of the cases were concentrated in Male' which has reduced to 52.7% in 2020 indicating that more cases are being reported from the Atolls. A deeper focus on each atoll in Table 38 indicates that Cases captured by the Police have increased in HaaAlif, Kaafu Atoll, Shaviyani Atoll, Raa Atoll, Baa Atoll, Dhaalu Atoll, Faafu Atoll, Thaa Atoll and Vaavu Atoll. The atolls that have shown a decrease from 2015 to 2020 includes, Aalif ALIF Atoll, Alifdaalu Atoll, GaafuAlif Atoll, Gaafudhaalu Atoll, Gnaviyani Atoll,Haadhaalu Atoll, Laamu Atoll, Lhaviyani Atoll, Male'.Noonu Atoll and Seenu atoll. It can be noticed that infrastructural enhancements have lead to increased drug usage such as a 64% increase in drug use cases were observed in HaaAlif with the opening of the airport in 2020, and a 40% increase in Shaviyani Atoll with the establishment of the airport in January 2020.

Drug court data shows that the number of cases among the children (<14 years) have reduced in the past three years. In the adolescent age group also, there has been noticeable decreases. For example, in the 20-24 age group, it has fallen from 187 in 2012 to 74 cases in 2020, 160 cases in 25-29 age group has fallen to 89 cases in 2020.

3.1.2.12 Dynamics and trends in Substance use among juveniles 2014 -2020

Majority of the underage offenders were put under custody for abusing substance (24.8%), possession of drugs (38.2%), substance and possession of drugs (15.1%) (Table 42).

In Juvenile substance use cases, the trends have moved and expanded over the Atolls. In 2010, the most common atolls where juvenile cases of substance use were found in Kaafu Atoll (60%), Lhaviyani Atoll (10%), Gaafudhaalu Atoll (10%), Raa Atoll (10%) and Seenu Atoll (10%). In 2020, reports from additional atolls which were not there in 2010 began; Baa Atoll (0% in 2010 versus 1.33cases in 2020), Gaafu Alif Atoll (0% in 2020 to 2.6% in 2020), Gnaviyani Atoll (0% in 2010 to 9.33% in 2020), Haa Alif Atoll (0 to 5.33% in 2020), Haadhaalu Atoll (0% in 2012 to 1.33in 2020), Laamu and Meemu Atoll (0% in 2010 to 8% in 2020), Male' city (0% to 8% in 2020), Noonu Atoll (0% in 2011 to 6.7%), Shaviyani Atoll (0% in 2010 to 4%in 2019) and Thaa Atoll (0% in 2010 to 5.33% in 2020). There are few atolls with no record of juvenile cases of substance usein the past 10 years; Alif Alif Atoll, Alif dhal Atoll, Dhaalu Atoll, Faafu Atoll and Vaavu Atoll (Table 43).

Ten years ago, juveniles were mostly involved alcohol consumption (20%), Possession of drugs (20%), Substance Abuse(40%), Substance Abuse and Possession of drugs and robbery (10%) and Substance Abuse and Possession of drugs (10%). In 2020, it is found that juveniles were involved in drug abuse (18.7%), Drug trafficking (10.7%), Possession of drugs (20%), Possession of liquor (1.3%), Production of alcohol (5.3%) and substance abuse and possession of drugs (44%). (Table 44)

Table 44 shows the behaviors in relation to substance use among Juveniles from different atolls. Customized interventions can be designed for the juveniles of respective atolls using the following information. For instance, in Haa Alif Atoll, Juveniles were involved in dealing drugs, drug abuse, drug supplying and trafficking, possession of drugs and substance abuse. In Vaavu Atoll Juveniles are involved solely in drug trafficking. Hulhumale and Male city Juveniles were more into abuse of substances, supply and trafficking of drugs

3.1.3 Prevalence and Incidence of substance use and changes to the prevalence rate

Out of the 10,031 cases submitted to the Maldives Correctional Services during the period 2011 to 2020, 4370 cases were related to substance use and supply (44%). Comparing the prevalence of substance use and trafficking offenses in 2011 with 2019, there is a decrease in the prevalence from 50% in 2011 to 28% in 2019 (Table 46). Prevalence of Juvenile substance use rate as a percentage of the population in the respective age group shows a very minimal reduction in the prevalence of cases (0.07% in 2011 to 0.05% in 2019). Out of all the substance related cases treated at IGMH, 55.3% had to be hospitalized. (Table 47)

3.1.3.1 Prevalence by Age

92.4% of the offenders related to substance use/trafficking were in the working age population (20 – 55years) (Table 49). Number of offenders as a proportion of the population in the respective age groups showed that in 2015, the highest prevalence was in the age groups 30-34 years and 45-49years (0.04%). In comparison, in 2019 the highest prevalence was in the age groups 25-29 years(0.07%), and 30-34years(0.06%). Changes in the prevalence of offenders in substance use/trafficking over the past 4 years showed the largest in the age group 20-24 years(3.8% increase).

Cases submitted to the Drug Court on substance use as a percentage of the population in that age group shows that 19 to 24-year-old were the most prone to substances in the Maldives; but the prevalence has reduced over time. In 2014 the prevalence was 0.5% among 19-24 year olds, compared to 0.3% in 2019 (table 50). This data excludes traffickers and suppliers.

Reported cases of substance use seeking health care at IGMH shows that 22.3% were in 25-29 year age group, 20.8% were in the age group 19-24 years, and 16.5% of the cases were in the age group 30-34years. 13% of the substance use cases seeking health care were adolescents. Contradictory to data from all other sources, Outpatient and Inpatient data of substance use cases from IGMH shows that 3.9% of all substance use cases were below 14years old (Table 51). Over the past 5 years, the percentage of below 14 years children as a proportion of 0-14 years population seeking health care for substance use have increased by 0.8% from 2015 to 2019. The percentage of 15-19 year olds seeking health care for substance use has increased by 1%, (Table 51). Over the past ten years, the percentage of elderly seeking health care for substance use has increased from 0% in 2011 to1.4% in 2020 and underage users seeking healthcare has increased from 1.3% in 2011 to 5.7% in 2020 for 0 – 14 year olds, 16% in 2011 to 20% in 2020 for 15 – 19 year olds.

3.1.3.2 Prevalence by Gender

According to data from Maldives Correctional Services 1988-2021, prevalence of substance related cases among female was very low at 2% while female prevalence of all other types of crimes was at 4% (Tables 53). This is reflected in the data from the Maldives Police Service where the Incidence of substance related cases reported by the Police shows that 4.9% of the cases were females (Table 54). Over the past 5 years, prevalence of substance use/trafficking by gender has reduced from 0.01% in 2015 to 0.001% in 2019 which is 0.9% reductions for females and 0.7% reduction in males.

3.1.3.3 Prevalence by Resident Atoll

Over the past five years (2015-2020), 64.9% of the substance related incidents reported by the Police occurred in the capital city. Incidents out of capital city were most common in Seenu Atoll (7.4%), Gnaviyani Atoll (4.9%) and Kaafu Atoll (3.5%) (Table 55).

3.1.4 Systemic findings related to substance use

It was seen that the percentage of female users of substances, seeking care at IGMH has increased over time (0% in 2011 to 3.6% in 2020) (table 57) which shows that the healthcare system is welcoming and trusted by substance users.

Data from Correctional services show that the duration between sentencing and implementation of the conviction ranges from < 90 days in 43% cases, 90-180 days in 3% and in 26% of the cases it has taken 3years. For more than 48% of the cases who gets to remain in the community without being sentenced giving them the opportunity to relapse or be exposed to further crime. For those who do reform themselves, this delay becomes a demotivation.

Client files (38 cases) from the NDA (Table 58) shows the gap between court order date and Program start date. It shows that the mean number of days in each year has widened with almost a year being spent in 2020 (394 days), 184 days in 2019 and 275 days in 2018. Only 52.6% completes the program they start at NDA. 31% of clients do not create the communication channel with their families during their treatment at NDA. 36.8% terminated the program. Others were not identified. The number of clients seeking care at the NDA has increased over the past 5 years. Female clients contributed 2.6% of all clients, only 2.9% approached willingly to NDA care. The mean age of clients seeking care at NDA has fallen from 31.4 in 2015 to 29.6 in 2020.

Data from the Drug Court among the offenders who were given the order for assessment, it is noted that the average number of days spent between the received date and assessment order date has been reduced every year from 2012 to 2020. This shows efficiency of addressing cases at the drug court' has been improved. Among the offenders who were given the order to be placed in rehabilitation, the average number of days spent between the assessment order date and rehab transfer date ranged from 12 days to 226 days over the past 9 years.

3.2 Findings from Drug Use Survey

3.2.1 Demographic Characteristics of Participants

The median age of drug users was 35years, with the youngest being 16years and the oldest being 58 years. When age was grouped, it was observed that the sample was representative of all ages from underage users to the elderly users in the country. Ninety five percent of the users were in the working age population and 94% were males (figure 2). All the age groups were represented in the selected sample. However, female population was very limited. Majority of the users had an educational level till middle school (Grade 6 – 9) (49%), 31% of the users had completed high school and 7.2% has completed college. It is important to focus interventions to middle school students as this is the point where most dropouts have happened (figure 3).

FIGURE 2: SAMPLE OF SUBSTANCE USERS BY AGE AND GENDER

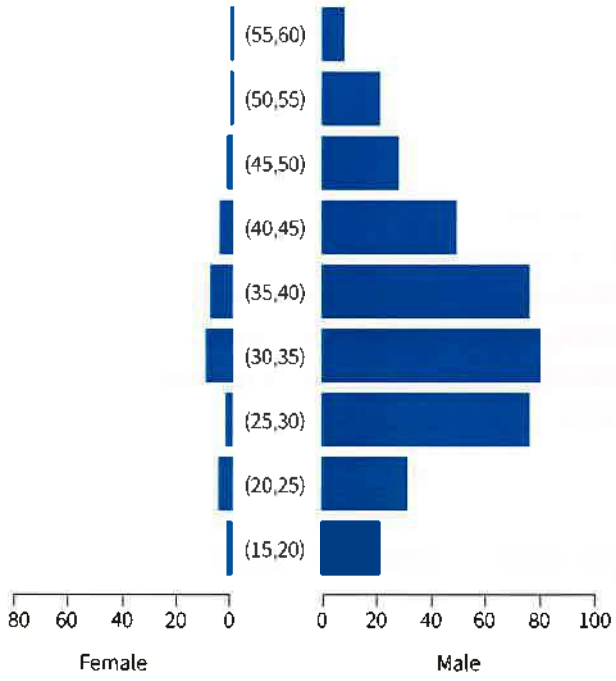

FIGURE 3: SAMPLE OF SUBSTANCE USERS BY EDUCATION LEVEL

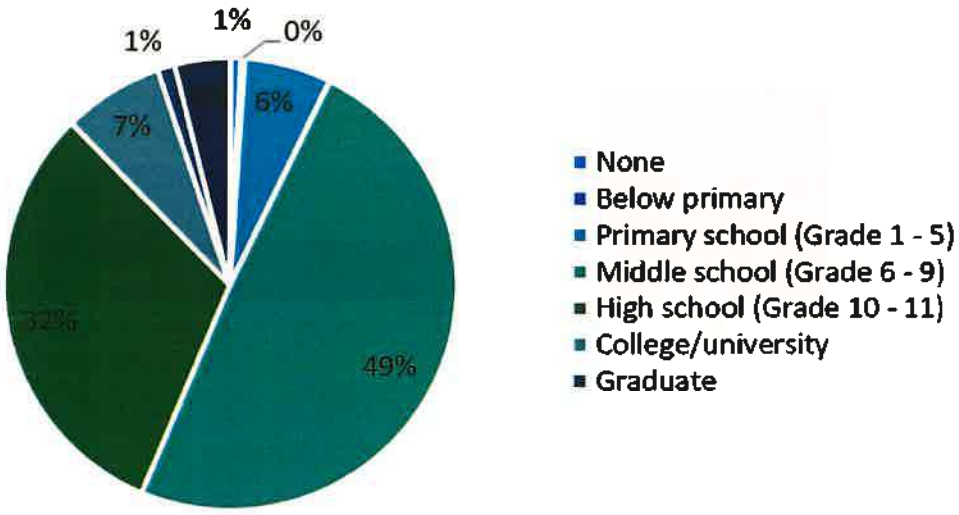

A quarter of participants, (24.1%) did not have any dependents. 58.6% of the users had people depending on them for their daily needs, which indicates the importance of including family sessions and to work with their families by NDA (figure 4). 3.4% of the sample constituted of foriegners (Figure 5) which highlight the need for service provision in multiple languages. Majority (67.7%) were employed. Fishing (12%), Technical (12.6%), Manual work (11.8%), Business (11.1%), Tourism (8.2%), Agriculture (2.4%), drug related work (6.1%) and others(3.4%). Many were found to have been doing one to 3 jobs (Figure 6). Majority of the users have encountered drug users at their workplaces (41.4%) (Figure 7). Many were single (40.9%), however, the balance leaves behind dependents hanging to feed for themselves (figure 8).

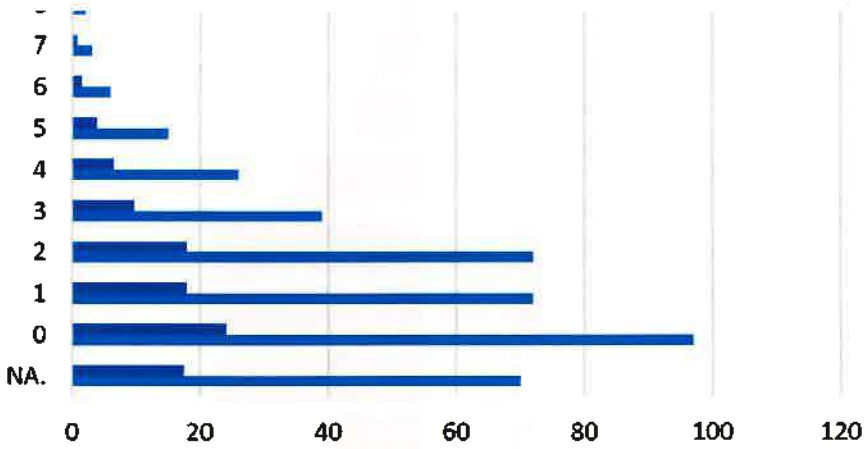

FIGURE 5: SAMPLE OF SUBSTANCE USERS BY NATIONALITY

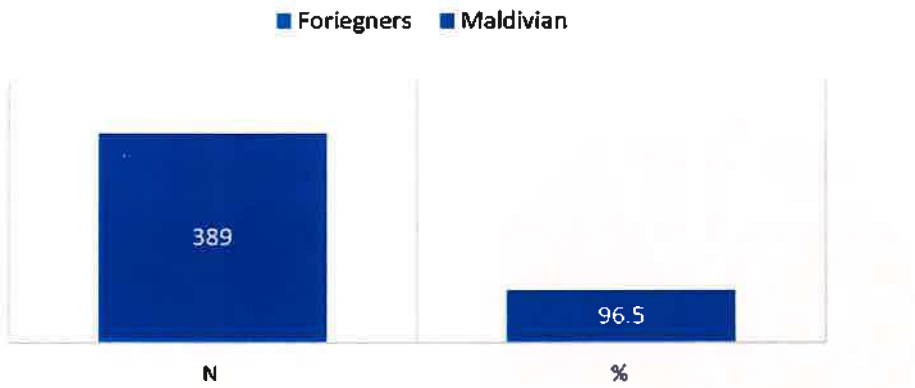

FIGURE 6: SAMPLE OF SUBSTANCE USERS BY OCCUPATION

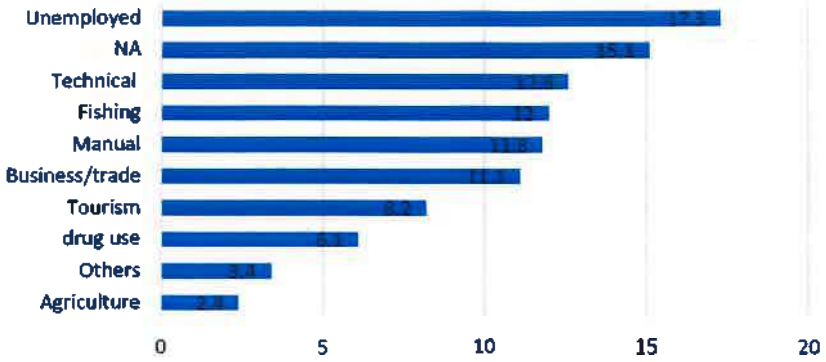

FIGURE 7: PRESENCE OF DRUG USERS AT WORKPLACE

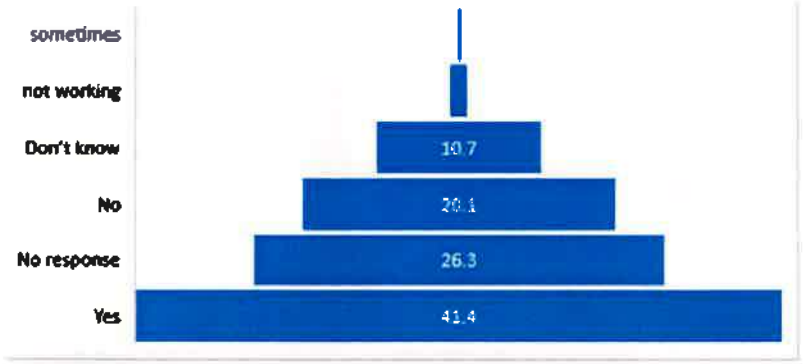

FIGURE 8: MARITAL STATUS OF THE SAMPLE OF SUBSTANCE USERS

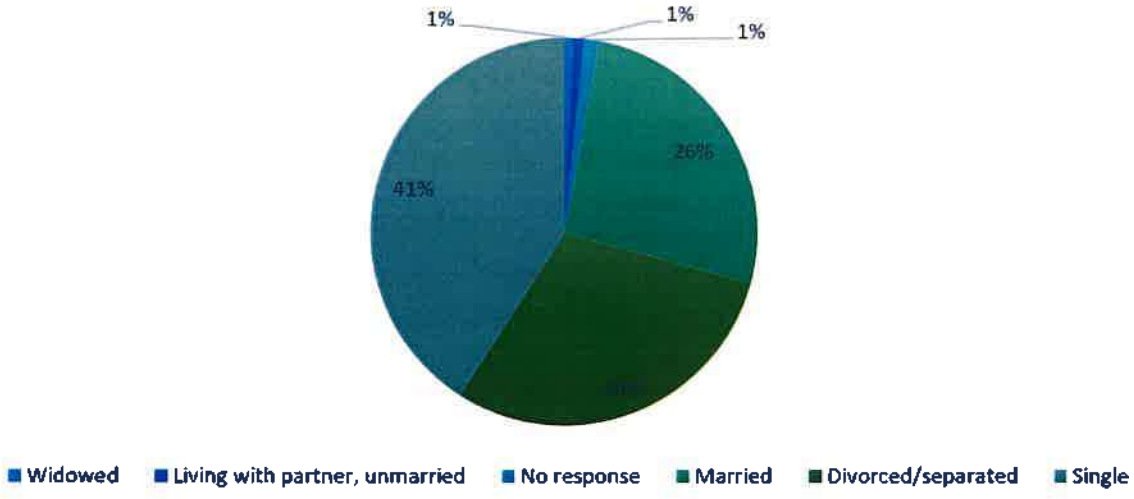

3.2.2 Drug Use and Pattern

Eighty percent of the sample were using drugs at the time of data collection, although more than 69.5% of the participants were under treatment at NDA (selected from the NDA client register) (figure 9). Brown sugar was the most commonly used substance (34.2%), alcohol (17.4%), Opioids (15.1%) and Hashish (13.4%). 50% have the knowedge that drugs are mixed and used (Figure 11). The onset of drug use has begun as early as 9years in this sample of drug users. It is important to note that onset of drug use does not happen above the age of 35. Majority of the users started using drugs before the age of 20. Less than 18 years comprises 57.8% (Table 62).

It was observed that instead of one sole reason, there were a combination of reasons that has led to the initiation of drugs among the sample. Peer influence together with other reasons was the major reason (72.2%), curiosity in combination with other factors (13.2%), Family issues with combination of other factors (4.2%) and Recreational (5.5%) (Figure 12). Peer influence was observed to be the main reason for the continuation of drug use by a majority of participants (30%), Addiction (26%), 23% said that drug use was continued for recreational use. Peer influence is seen as a protective factor and also as a risk factor (Figure 13).

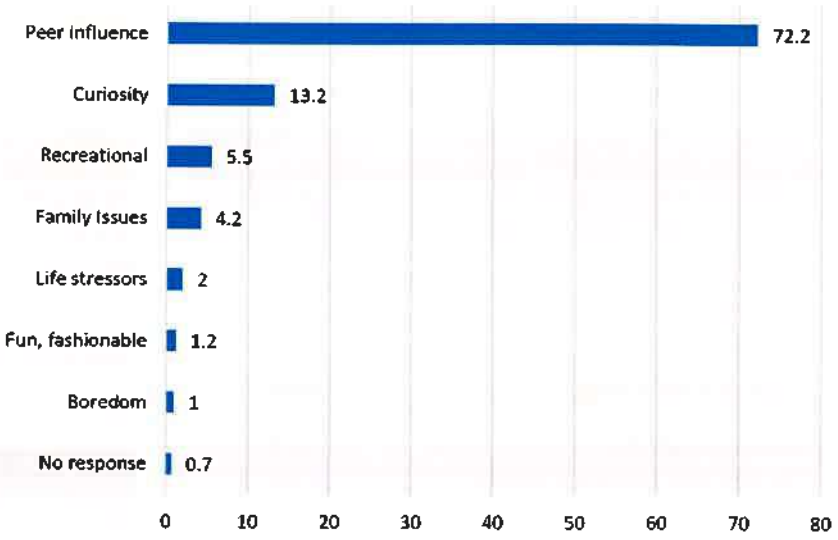

FIGURE 13: REASONS FOR THE CONTINUATION OF SUBSTANCE USE

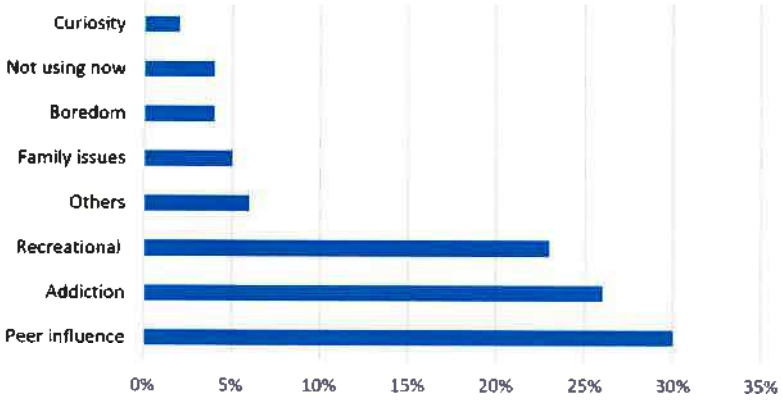

Local production is in existence (table 63). Fifty percent of the users were aware of the local production of drugs. 34% of the participants have tried locally produced drugs. Majority have not used locally produced drugs maybe for quality purposes (table 64). Most have used alcohol which comes in different terminologies such as Thona, Choh, Bogaru (31%) (table 65). Majority of the clients who joined NDA treatment (92%) believes that they have a drug problem. This belief is a good starting point for the recovery. It is believed that people join NDA to avoid jail term, but this data shows otherwise. It is also interesting to observe that half of the users who did not join NDA do not believe they have a problem. (Table 66). Majority attending NDA have attempted to stop using drugs (83.9%), while the majority among those who do not seek treatment (78%) have not attempted to stop ever (table 67).

The 3 main reasons for stopping drug use include Legal consequences (28%), Family reasons (19.3) and peer influence (7.3%) (figure 14). Treatment was found to be the most commonly used strategy to stay sober, while religion, family, and work were other ways that substance users used. 66.3% of the participants have been arrested at least once for drugs (table 66). Majority of the participants have been arrested more than once (figure 16). For the majority (71.7%) the monthly expense on drugs was below 20,000 Mrf. A variety of sources were identified. Mostly it is not one source that people depend on to buy drugs, but a combination of sources. Borrow, beg, peddle was the most common way of getting money (49%) and the second most common source was own income either through salary or rental income (37%).

3.2.3 Associated High Risk Behaviors

More than 92% of the users consume tobacco which indicates the gateway to drugs (Figure 17). A small percentage of users have used flesh trade to seek drugs (3.7%) and it was significantly different by sex (p< 2.2e-16). Half the female participants have traded sex for drugs (45.8%) while it was only 1.06% among males. (Table 71 and 72). Among those who traded sex, the reason for the flesh trade was to purchase drugs (54%). A concerning reason for the flesh trade was human trafficking (18.2%) which makes the users vulnerable to many other crimes too (Figure 18).

Other illegal activities that the human traffickers have forced drug users to commit include theft, loot (45%) and peddling (27%) (table 73). Majority of the users have put themselves at the risk of sexually transmitted diseases by having multiple partners for sex (68%) (Table 74). On top of it, 66% do not use any form of contraception (table 75). Injecting drug use was prevalent at 21.6% (table 76). Among the IDUs (and others who responded to the question), 43.6% shares their needles with peers (Table 77). Majority knows 1 to 10 IDUs (23%) (Table 78).

New needle or syringe was used by 37% of the injecting drug users. 62% of the users use previously used needles (table 79). Among the IDUs, needles were used multiple times by majority of users (77.6%). Majority (83%) of the IDUs have begun injecting before they turned 30years. Among IDUs, majority of the IDUs have not used an IDU Hangout for injection (Table 82). Majority (73.1%) carrys their own needles but many of the IDUs found new needles not accessible even to buy (59%).

3.2.4 Access to care and Quality of treatment

More than a third of the sampled drug user population has not sought treatment or healthcare (34.2%). Very few (8.9%) voluntarily sought care which was very brave of them. Majority of the cases sent for treatment were through the drug court (56.1%) (Table 85). Many do not think they need treatment (33%) and others believe they can manage on their own. The median (average) number of days taken to do an indicative assessment was 90 days (Table 86). Among those who responded to this question, 45% had to wait less than 3months, while the other 45% had to wait more than 3 months for the completion of their indicative assessments. Median number of days a client waited for his/her treatment to begin after the indicative assessment was 300 days. It ranged from 1 day to 2920days. 24.6% waited less than 3 months while 31.4% had to wait 1 – 2years to join a treatment program or receive treatment (table 87). During the waiting time, more than one third of the participants have relapsed and started using drugs (40%) Table 91. 41.4% have managed to successfully complete the program that they joined. 14.9% did not complete it (Table 89). Majority have completed the Detox, DTRC and Community Program (41%) Table 90. Relapse is a part of the recovery, and 42.7% have relapsed after completing the program. Median number of days client stayed sober after completing the program was 240 days. It ranged from 0 days to 4380 days. 18.8% stayed sober for 3months (Table 92)

3.2.5 Determinants of Drug Use

Eighty nine percent of the users have access and easy transportation between the resident islands and nearby islands (table 97) and 50% of them travels to nearby islands (table 98). Majority is positive about finding employment opportunities on the resident island and nearby islands (table 99). More than a third do not know if educational vocational or skill development opportunities are available on their resident islands or nearby islands (table 100). 54% thinks that the required medical care is available on the resident island (Table 101).

3.3 Findings from Key Informant Interviews

Based on the key informant interviews and focus group discussions a total of 173 themes were identified, these themes have been catogarised to main 5 themes which are, challenges, coordination, enforcement, Policies and approaches and attitudes.

Theme 1:

The theme reflects the challenges faced by stakeholders in providing a service for recovering addicts, this includes, government and non-government agencies. The identified challenges are the lack of human resources, due to this lack of human resources; staffs are over worked specially the counsellors, counselors are involved in multiple positions/tasks, the counsellors experience burn out and that there is a need to train more counselors and other staff. As mentioned by some of the informants in the given excerpt below,

> *R(1)*
>
> *"As mentioned previously, we counselors are doing lot of work, the work counselors are doing is impossible for them to do alone..."*

> *R(2)*
>
> *"In the month of Ramadan lot of work was done to start MMT program, but I think it has also come to a stop because there are no enough staff..."*

> *R(5)*
>
> *"In the month of Ramadan lot of work was done to start MMT program, but I think it has also come to a stop because there are no enough staff..."*

> *R(2)*
>
> *"The truth is that a counsellors role is very broad, what to say, I think we don't even have ethical standards or a policy regarding handling a case..."*

> *R(2)*
>
> *Truth is, human resources has not been built, it's very difficult to maintain trained staff, most trained staff leave, it is crucial to identify why the trained people are leaving the organization when there is a lack of human resources.*

A sub theme that came up was increased drug users in the community, this increase of drug users in the community creates makes the recovering addicts difficult to maintain there abstinence, the increased waiting period is a factor that ontributes to increase in the users in the community

R(15)

" the current treatment system has failed, due to this drug users are freely raoming around and they influence and put pressure on the client who just returns from a treatment center"

R(20)

"I think drug use is a huge problem, we don't see the number of users decreasing, there still in the community and they are actively using"

Lack of proper infra structure, use of delapidated buildings for treatment centers and lack of treatment centers were another sub themes that was identified.

R(4)

"There is a female rehab inside DTRC, there is a detox center, but it's just name boards, capacity of this place is 75 clients, when we run the place in full capacity, how can we conduct a proper program for the female rehab clients, only 90 day classes they can attend, it is not a program, just days spent, ...even in villigili rehab, it is a place that no one should be taken, the buildings so ruined".

Theme 2:

The second main theme was coordination, it was identified that there is a lack of coordination among the agencies that are working in the field including government and non-government organizations, and in addition, there is a lack of coordination within NDA itself. It was identified that there is a need to update the NDA system to electronic coordination to avoid coordination issues within NDA another sub theme that came up was development of a data base and online application.

R(6)

"Since ages the relationship and coordination between the NDA head office and the centers under NDA has been difficult, individual client files are manually handled and transferred from one center to the other, in this transferring process there is high chance of files and documents being misplaced, but I don't think any work is being done to reduce or stop such incidents from happening...there is a need for a good data base system or an online application where real time files get updated and viewed..."

Theme 3:

Third theme was enforcement. Based on the sub themes, the enforcing agencies are unable to enforce the policies properly, this includes, police and NDA, it was identified that to some extent confidentiality was not maintained which in itself creates problems. In addition due to the lack of enforcement, especially in islands the availability of drugs are very high in the community. It was also identified that NDA is unable to provide enough appropriate treatment (that is the reduction of wait list) which results in people engaging in crimes and addiction.

> *R(916)*
>
> *"In a way I can say that the supply is increased based on the demand…in this island drug peddling and selling is very open.. law is not enforced properly…since 2013 there are main 2 to 3 drug selling points…its like walking in a little shop… if you have a job they will give you the drug they will lend it to you too"*

> *R(17)*
>
> *"Tourism industry is very important industry, so may be the tourist checking is leaniant on arrival to Maldives, …at times it is possible to get the drugs from tourists too.. and in resorts locals also can get the access to alcohol if they want to…"*

Theme 4:

Policies was another main theme identified, in this theme, it was identified that the existing law and poilicies are generally good, which allows treatment opportunities for drug users. It was identified that standard operating procedures are required, when it comes to coordinated care for clients who have cormobid conditions and are under treatment provided by multiple organisations. It was also identified that NDA mandate is too heavy to be carried out solely by NDA and NDA is not capable to provide different approaches of trearment under the NDA umbrella, this has led NDA not being able to follow the policies properly.

> *R(21)*
>
> *"The law and policies are very good...now the clients have the opportunity for treatment"*

> *R(1)*
>
> *"...even if they relapse they get the opportunity for treatment... they are not terminated from the program..."*

> *R(3)*
>
> *"NDA alone cannot do this work. SoP's are also there, its now more than 3 years since such SoP's have been developed, they need to work with the NGO's.. include NGO's too...this work is too heavy for NDA alone..."*

> *R(7)*
>
> *"We also work with drug clients... at times we don't know whether NDA will be treating the client for the drug addiction...clear SoP's are required, so that we will know who does what... since the client has other mental health conditions we will be working with that particular client"*

Theme 5:

The last theme identified was approaches and attitudes. It was identified that the drug situation in the country is bad at present. The country is in dire need of more treatment centers to be established across the country and multiple approaches to treat drug users. It was also identified that there is need for aftercare program along with focusing more on drug prevention programs. Furthermore, the sub themes of conducting awareness programs and involve families and community in treatment to facilitate community and family reintegration of clients. It was also identified that the community do believe that the clients from NDA are clean for a while but eventually they relapse. It was identified that NDA itself needs develop a positive attitude towards the treatment and clients to attract more clients to the program.

4. DISCUSSION

This study has analyzed two sets of quantitative data to achieve the objectives. One is secondary data at 7 stakeholder institutions collecting surveillance data on different aspects of drug use and supply over a period of ten years (2011 -2020). Secondly, drug user survey data of more than 400 users representing all the 21 Atolls of the country. The main findings from both the data sets demonstrates that the industry is still a very male dominated one. Age wise, it is the working age population that is benefiting and suffering from this trade. Over the past ten years, users and suppliers have become younger, and the share of the elderly is growing. New trends in the substance industry of the Maldives includes the introduction of new psychotropic drugs, the move from South Asian source countries to European countries as sources of drugs, change from air and sea to mail as the transport mechanism , an increase in the accessibility of substance users to the medical care system, long waiting time to access treatment programs by NDA, the expansion of local production of substances, human trafficking among drug users and forcing them to commit other illegal activities, lack of community support, use of multiple sex partners and multiple use of one syringe where unavailability to new syringes were highlighted.

While the Maldives has quite an equal sex ratio of 108 males per 100 females (NBS 2021), both secondary data and primary data collected for this study confirms that the female involvement in the drug use and supply is disproportionately limited in the Maldives. Findings show that the proportion of female involvement in illegal import of drugs to be slightly higher than their involvement in drug use. Juvenile female involvement of substance abuse at 7.8% was higher than the overall proportion of female prevalence at 6%. The low female participation is congruent with previous drug use assessments of 2003 and the national drug use survey of 2011 which showed 97% and 95% male representation in the drug industry of the Maldives. Female participation in drugs have shown to disrupts family life, affects kids, restricts access to health care and makes them prone to domestic violence and crimes (Olphen J.V etal, 2009). The ability to maintain low levels of female participation is an encouragement for the service providers to strengthen their efforts at prevention of vulnerable populations from the substance industry.

According to the latest Census of the Maldives 68% of the population comprises of the working age population 15 – 64 years of age (NBS 2021) and this is reflected in the ages of the substance users and suppliers. Findings from the survey and secondary data shows that the majority of users comprises of the productive working age population 19- 65 years. Involvement in the drug offense by the elderly has risen from 0% in 2015 to 0.1% in 2020 which may be existing users getting older. While the retirement age in the Maldives is 65years, increasing number of elderlies among the drug trade will impose additional burden on the country's health system.

Over the past ten years, most of the juvenile cases of substance use and trafficking were observed in the ages 14 – 17 years and more than half of them were out of school. Drug usage while going to school was slightly higher compared to those who have completed school. School drop out rates in the Maldives have been found to increase at the age of 16 and out-of-school youth are left without a safe, productive outlet to fill their time, and are more at-risk of joining gangs, getting involved in crime, and abusing drugs (UNICEF, 2021). Drug Use Survey 2021 has also shown that the majority of the users had an educational level till middle school (Grade 6 – 9) (49%). 31% of the users had completed high school and 7.2% has completed college. It is important to focus interventions to middle school students as this is the point where most dropouts have happened.

No atoll in the country is free of substance use with the highest prevalence seen in Kaafu Atoll including Male' city and the Southernmost three atolls – Gaafu dhaalu Atoll, Gnaviyani and Addu city. Improved infrastructural structures such as establishment of airports, ferry systems between islands, facilities for care and services increases mobility and access to substances as well. While mail has been found to be the major transport mechanism for drugs, the number of inward mails handled through international flights at Ibrahim Nasir International Airport have increased by 138% during the period 2015 – 2019 (NBS, 2016 and 2020). Mail handled through domestic flights from Seenu Gan Airport has also increased by 196% during the period 2015 to 2019 (NBS, 2016 and 2020).

Drug use survey 2021 has also identified a small proportion of foreigners which highlight the need for service provision in multiple languages which are culturally fit. Majority of the drug users were employed and were found to have been job peddling from one to 3 jobs. Ten years ago, the employment rate among drug users was 42% compared to 67% in 2021 which is an improvement in the structural changes made by the government such as the nullification of police records for those completing treatment programs and due to the positive attitudes of current employers.

On the supply side of drugs, this analysis has identified drastic changes from that of ten years ago. The age of illegal carriers has changed from the youth in 2011 to the adolescents (15 – 19 years) and elderly in 2021. Statistics from JJU has shown that the majority of the underage substance users were put under custody for possession of drugs. This implies that juveniles are at risk of being used for drug trafficking and peddling because of their chances for getting caught is low and the law provides leniencies for underage offenders.

The last port of departure for the drugs have changed from South Asian countries (such as such as India, Bangladesh, and Sri Lanka) to European countries (such as UK and Netherlands). Drug concealment in the baggage and on the body of the person has transformed

to mail and on the person. The type of drugs illegally being imported into the Maldives has also seen radical changes over the past ten years from Cannabis(herbal) and heroin in 2011 to Cocaine, heroin, cannabis (herbal) and psychotropic MDMA in 2020. This reflects the global trends in the manufacture and distribution channels of drugs worldwide.

According to the world drug report 2021, global cocaine manufacture has doubled over the 2014 – 2019 period, the seizure of synthetic drugs was 170 times larger compared to 2001, and cannabis herb was the most seized drug globally compared to cannabis resin and cannabis oil (UNODC, 2021). The move from south Asian countries to the European countries for the supply of drugs (from UK, Germany, Netherlands etc) can be explained by decriminalization and legalization of some substances in these countries.

On the demand side, the mixture of medicines, opioids, benzodiazepines and antihistamines, is predominant from the tests conducted at the NDA Laboratory 2016-2020. Currently, NDA has the capacity to test for 7 groups of substances which needs to be enhanced with more advanced testing technologies to prepare for the changing trends in mixed combinations of substances. For example, long term exposure to various xenobiotics can be detected for 17 analytes with as little as 5mg of hair using the solid phase micro extraction (SPME) together with gas chromatography mass spectrometry (GC/MS). This is a non-invasive biomarker which could be used on newborns too and also can be used to analyze prevalence more accurately. majority of clients were positive for Opiate and Benzodiazepines (67%), 29% were positive for a combination of THC and Opiates and 8% for THC and Benzodiazepines. Research has found a high prevalence (93%) of nonmedical benzodiazepine use among nonmedical opioid users among young adults (PedroMateu-Gelabert etal 2017). The concurrent use of substances referred to as the South Asian Cocktails has been found to show a higher rates of HIV infection and more co-infections compared to the other drug users among injecting drug users of Nepal (Saroj Prasad Ojha etal 2014).Data on health care seeking behavior of substance users from IGMH data shows that the trend in the type of substances used have changed over time. In 2011, it was alcohol (33%), unspecified drugs (33%) and history of other diseases (33%) but in 2020, opioid, cannabis, sedatives, and psychoactive substance were the most. Majority of cases were diagnosed with 'F11-Opiod related Disorder', 'F19-Other psychoactive substance related disorders' (17.8%) and 'F12-Cannabis related disorders' over the 10-year period of analysis. Changes in the demand looks like demand has been created to cater to the whims of the suppliers of drugs who follow the global access pathways. Harm reduction measures and proactive awareness and preventions measures needs to be conveyed to potential susceptible groups.

Period prevalence of substance use (2011 – 2020) is at 44% of all offenses/crimes at the Maldives Correctional Services represent substance use and traffickers. Prevalence of Juvenile substance use rate as a percentage of the population in the respective age group 0.07% in 2011 to 0.05% in 2019. In 2015, the highest prevalence of drug use was in the age groups 30-34 years and 45-49years (0.04%) compared to the age groups 25-29 years (0.07%), and 30-34 years (0.06%) in 2019. Global projections of drug users for 2030 by age groups calculated using data from Africa shows that the highest concentrations of drug users in the range of 25 – 39 years which is also the trend in the Maldives. The Maldives population projections 2030 also forecasts a 9.2% increase in the population of age group 25 – 39years (NBS, 2021).

Brown sugar was the most commonly used substance, with alcohol, Opioids and Hashish following it. The onset of drug use has begun as early as 9years and lasts till 35 years in this sample of drug users. It is important to note that onset of drug use does not happen above the age of 35. Instead of one sole reason, there were a combination of reasons that has led to the initiation of drugs among the sample. Peer influence together with other reasons was the major reason, curiosity, Family issues and Recreational purposes. Peer influence was observed to be the main reason for the continuation of drug use by a majority of participants. Peer influence is seen as a protective factor and also as a risk factor. Local production is in existence and one third of the participants have tried locally produced drugs.

A number of risk behaviors among drug users were identified. Consumption of tobacco, similar to 2011 survey acted as the gateway to drugs for most drug

users. A small percentage of users were forced to use flesh trade to seek drugs where half the female participants have traded sex for drugs. Prevalence of human trafficking was observed among the users which makes them vulnerable to many other crimes too. Other illegal activities that the human traffickers have forced drug users to commit include theft, loot and peddling. Majority of the users have put themselves at the risk of sexually transmitted diseases by having multiple partners for sex where many do not use any form of contraception.

Injecting drug use was prevalent at 21.6%. Among the IDUs, almost half of them shares their needles with peers. Majority use previously used needles. Majority carries their own needles but many of the IDUs found new needles not accessible even to buy. Easy affordable access to care is vital to keep the users.

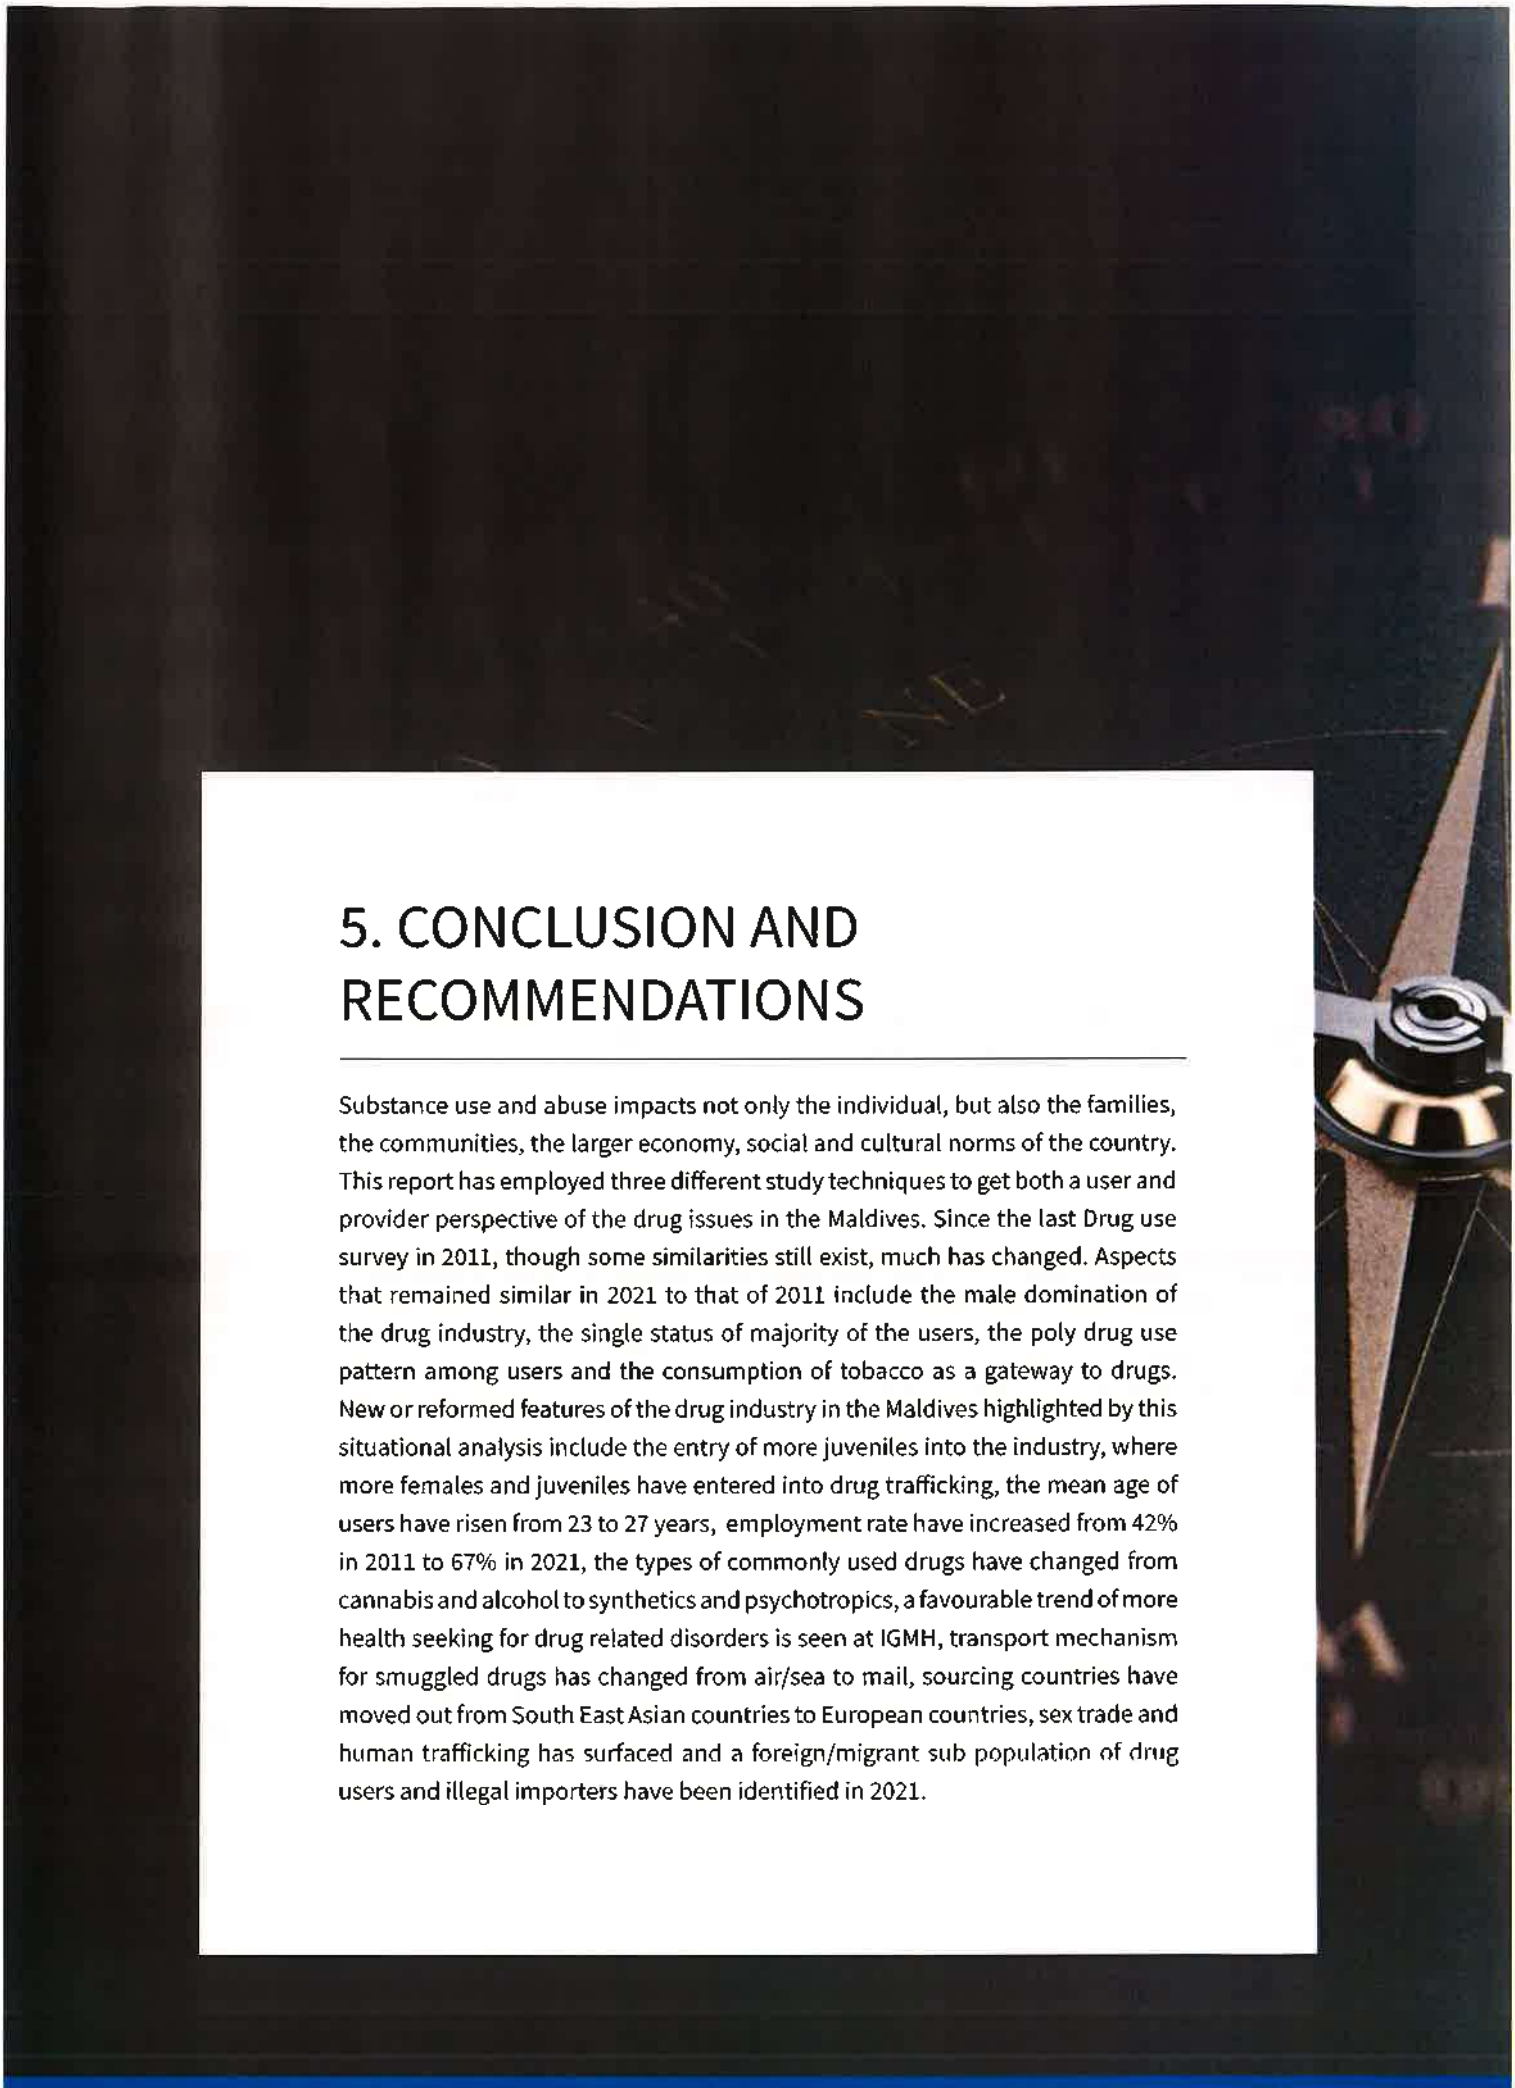
With regard to treatment for drug users, more than a third of the sampled drug user population has not sought treatment or healthcare and very few voluntarily sought care which is very brave of them. This also shows the need for the government to assist them to proactively seek health care. The median (average) number of days taken to do an indicative assessment was 90 days. Almost half of the participants had to wait more than 3 months for the completion of their indicative assessments. Median number of days a client waited for his/her treatment to begin after the indicative assessment was 300 days. Many has relapsed during the waiting time for assessments and treatment programs which highlights the need for more resource allocation towards faster service provision for drug users. Majority of the users were willing to access care if it was offered in a hospital or in a drop in center. It is encouraging to note that majority of the drug users attending NDA have attempted to stop using drugs, while the majority of those who do not seek treatment have not attempted to stop ever.

Majority of the users receive help from their families once they complete treatment. However, a large proportion of the users admitted that they did not get any support from the community. Job Opportunities, love, support, acceptance and removal of stigmatization were the types of support that users have requested to hope they receive from the Community. According to Buchan 2004, social exclusion is the most significant barrier to recovery, while illicit drug dependence has been identified as the most stigmatized health condition In the world by WHO (Best D, Blird K and Hunton L, 2015). While the family is the immediate recovery context that enables a recovery identity, family focused interventions and community focused interventions are required to create a positive community attitude.

The Drug use survey of 2011 analyzed secondary data from 3 institutions (MPS, DRC and DIC only). In 2021, twenty organizations were approached in the situational analysis of drugs in the Maldives. Out of which, 9 institutions responded with data. It is important that all data are integrated and analysed annually to provide the necessary evidence for policy making. Among the secondary datasets, only very few institutions collect data on educational level (JJU and NDA) or on occupation. Data from 2020 was very different from all the other years in all secondary data which indicates that usage of 2020 data for any purpose should be made with caution.

Limitations

This is not a prevalence study. To estimate prevalence a sample of both users and non-users is needed. Accessing such a sample would be beyond the timeline of this project in a legally and culturally stigamized setting such as the Maldives. Hence prevalence was calculated from existing secondary data. Secondary data acquired from institutions was collected in the templates currently used by the institution, which may be prone to human errors in data entry. For example, there were no repeat offenders in the dataset of correctional services in the years 2019, 2020 and 2021 which could reflect a policy change or may have been data entry errors. The responses for the drug user survey were self reported and will be prone to biases and lacks proof or evidence of the response. Since LGA was not involved, island level data are missing in this study.



5. CONCLUSION AND RECOMMENDATIONS

Substance use and abuse impacts not only the individual, but also the families, the communities, the larger economy, social and cultural norms of the country. This report has employed three different study techniques to get both a user and provider perspective of the drug issues in the Maldives. Since the last Drug use survey in 2011, though some similarities still exist, much has changed. Aspects that remained similar in 2021 to that of 2011 include the male domination of the drug industry, the single status of majority of the users, the poly drug use pattern among users and the consumption of tobacco as a gateway to drugs. New or reformed features of the drug industry in the Maldives highlighted by this situational analysis include the entry of more juveniles into the industry, where more females and juveniles have entered into drug trafficking, the mean age of users have risen from 23 to 27 years, employment rate have increased from 42% in 2011 to 67% in 2021, the types of commonly used drugs have changed from cannabis and alcohol to synthetics and psychotropics, a favourable trend of more health seeking for drug related disorders is seen at IGMH, transport mechanism for smuggled drugs has changed from air/sea to mail, sourcing countries have moved out from South East Asian countries to European countries, sex trade and human trafficking has surfaced and a foreign/migrant sub population of drug users and illegal importers have been identified in 2021.

Although drug use has a long history in the Maldives since 1977, stakeholders in the industry are still working solo. All datasets of all stakeholders together can help draw the big picture that needs to be understood in order to design targeted interventions. For instance, data of drug use or abuse in the schools of the country was not available for this study, but data from Juvenile Justice Unit informed the educational level of juvenile drug users. Increasing number of users seeking health care at IGMH may imply reducing trend of stigma in the society but families and the communities are still in need for transformation of attitudes towards substance use. Based on the qualitative data, it is crucial to buid human resources and improve the existing infra structures. Implementing existing policies and developing new approaches are vital components to improve existing services. Improving coordination and being up to date with the current digital systems such as implementation of data bases and online applications are methods that will help in easy access to client informations. Below are some of the recommendations that would assist in understanding and addressing the substance use and abuse in the Maldives:

Design targeted prevention measures for the youth, adolescents and the elderly.

Special attention needs to be given for grades 6 – 9 and the period of transition from O Level completion and beyond.

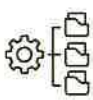
Awareness for parents regarding juvenile use for drug peddling, and use.

Close monitoring of school dropouts and students not attending school

Insitutions that already collect personal data of drug users must expand its variables to include education level, occupation, family details

Some institutions maintain data in the local language which makes it difficult to exported and analyzed in standard analytical tools.

New technological advancements to test for additional chemicals (recently introduced new ones such as MDMA meow, MDMA ecstacy, MDMA molli) for NDA.



A comprehensive integrated data management system where data from all the relevant institutions can be viewed at the same time is important.

Repair the dis-integration inside NDA; for example, NDA alone provided three different datasets (one from the laboratory, one on client register, one on indicative assessments. Client register is electronic but lacks important information about the client, Indicative assessment is managed manually but contains indepth information about the client, screenings, treatment, etc)

Some data is kept in pdf format and unavailable to be used in standard analytical tools.

Increase the role of NGOs at island level and atoll level institutions in the provision of care, prevention and data management.

Introduce services for migrants, expatriate workers especially the unskilled foreign workers.

Minimise the waiting time between drug court orders and assessment completions, OR assessment completion to treatment or to the implementation of the sentence.

Strengthen prevention services targeted for women and other vulnerable populations.

Appendix B: Questionnaire

Situational Analysis of Drug Use in the Maldives, 2021

Interviewer instructions

1. The interviewer should fill in the "Codes" and "Answers" column by circling or writing in the correct response code.

2. Ask the questions in order. Make sure to follow the skipping and screening instructions. If there is no particular skipping instruction associated with an answer, go to the next question.

3. If the instructions say PROMPTED, please read out the possible answers, excluding 'don't know' and 'no response'. If the instructions say SPONTANEOUS, do not read out the answers. Make sure you circle or tick the correct number of answers, i.e. 'ONE RESPONSE' vs 'MULTIPLE REPONSES'. Simple questions such as yes or no questions do not have instructions – for these the answers should not be read out, and only ONE RESPONSE circled.

4. Please try to fill in all questions. If the respondent refuses to provide an answer, present this as 'no response'.

5. For all subjects who agree to participate, please read the following introduction and consent form.

BLOCK 2: ASSOCIATED HIGH RISK BEHAVIOURS

Thank you for agreeing to take part in this study.

This project aims to identify the current dynamics of drug use and addiction in the country, identify the major changes in the trends and onset of substance use and estimate the prevalence and Incidence of substance use and changes to the prevalence rate. You will need about 30 minutes to answer these questions.

Your participation in this survey is voluntary, you have right to not answer any personal question or withdraw and stop your participation at any time during the survey. Please note that you do not need to mention issues that you do not want. This will not affect your rights or opportunities to your access to any service in the future.

We hope that you will participate in this survey and answers the questions openly and honestly because your opinions is very important as this survey.

If you agree to participate in the interview, all the information you share with us will be confidential. I will not write down your name or your license number. Do you have any question on the survey?

Would you like to participate in the interview now?

C1. Was consent obtained?
